

Features

- Temperature ranges
 - Commercial: 0 °C to +70 °C
 - Industrial: -40 °C to +85 °C
 - Automotive-A: -40 °C to +85 °C
 - Automotive-E: -40 °C to +125 °C
- Speed: 70 ns
- Low voltage range: 2.7 V to 3.6 V
- Low active power and standby power
- Easy memory expansion with \overline{CE} and \overline{OE} features
- TTL compatible inputs and outputs
- Automatic power-down when deselected
- CMOS for optimum speed and power
- Available in standard Pb-free and non Pb-free 28-pin (300-mil) narrow SOIC, 28-pin TSOP-I, and 28-pin reverse TSOP-I packages

Functional Description

The CY62256VN family is composed of two high performance CMOS static RAM's organized as 32K words by 8 bits. Easy memory expansion is provided by an active LOW chip enable (\overline{CE}) and active LOW output enable (\overline{OE}) and tristate drivers. These devices have an automatic power-down feature, reducing the power consumption by over 99% when deselected.

An active LOW write enable signal (\overline{WE}) controls the writing/reading operation of the memory. When \overline{CE} and \overline{WE} inputs are both LOW, data on the eight data input/output pins (I/O_0 through I/O_7) is written into the memory location addressed by the address present on the address pins (A_0 through A_{14}). Reading the device is accomplished by selecting the device and enabling the outputs, \overline{CE} and \overline{OE} active LOW, while \overline{WE} remains inactive or HIGH. Under these conditions, the contents of the location addressed by the information on address pins are present on the eight data input/output pins.

The input/output pins remain in a high impedance state unless the chip is selected, outputs are enabled, and write enable (\overline{WE}) is HIGH.

Pin Definitions

Pin Number	Type	Description
1–10, 21, 23–26	Input	A ₀ –A ₁₄ . Address inputs
11–13, 15–19	Input/Output	I/O ₀ –I/O ₇ . Data lines. Used as input or output lines depending on operation.
27	Input/Control	WE. When selected LOW, a WRITE is conducted. When selected HIGH, a READ is conducted.
20	Input/Control	CE. When LOW, selects the chip. When HIGH, deselects the chip.
22	Input/Control	OE. Output Enable. Controls the direction of the I/O pins. When LOW, the I/O pins behave as outputs. When deasserted HIGH, I/O pins are tristated, and act as input data pins.
14	Ground	GND. Ground for the device
28	Power Supply	V _{CC} . Power supply for the device

Note

1. Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at V_{CC} = V_{CC} Typ, T_A = 25 °C, and t_{AA} = 70 ns.

Maximum Ratings

Exceeding maximum ratings may shorten the useful life of the device. User guidelines are not tested.

Notes

9. Test conditions assume signal transition time of 5 ns or less timing reference levels of $V_{CC}/2$, input pulse levels of 0 to V_{CC} , and output loading of the specified I_{OL}/I_{OH} and 100-pF load capacitance.
10. At any temperature and voltage condition, t_{HZOE} is less than t_{LZOE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any device.
11. t_{HZOE} , t_{HZCE} , and t_{HZWE} are specified with $C_L = 5$ pF as in (b) of AC Test Loads. Transition is measured ± 200 mV from steady-state voltage.
12. The internal write time of the memory is defined by the overlap of \overline{CE} LOW and \overline{WE} LOW. Both signals must be LOW to initiate a write and either signal can terminate a write by going HIGH. The data input set-up and hold timing should be referenced to the rising edge of the signal that terminates the write.
13. The minimum write cycle time for Write Cycle No. 3 (\overline{WE} Controlled, \overline{OE} LOW) is the sum of t_{HZWE} and t_{SD} .

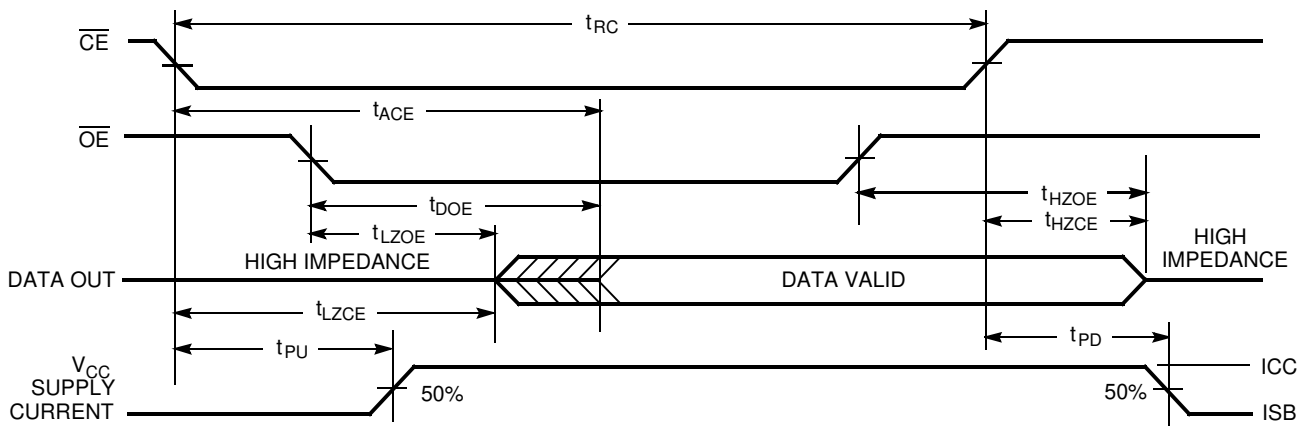

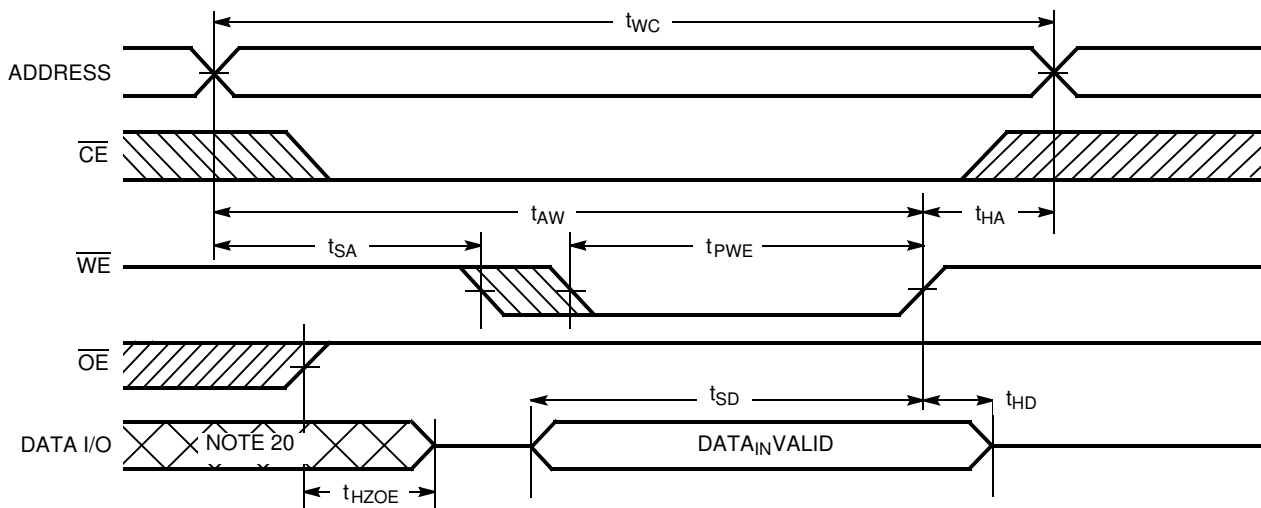

Figure 6. Write Cycle No. 1 (\overline{WE} Controlled) [17, 18, 19]

Notes

- 14. Device is continuously selected. \overline{OE} , $\overline{CE} = V_{IL}$.
- 15. \overline{WE} is HIGH for read cycle.
- 16. Address valid prior to or coincident with \overline{CE} transition LOW.
- 17. The internal write time of the memory is defined by the overlap of \overline{CE} LOW and \overline{WE} LOW. Both signals must be LOW to initiate a write and either signal can terminate a write by going HIGH. The data input set-up and hold timing should be referenced to the rising edge of the signal that terminates the write.
- 18. Data I/O is high impedance if $\overline{OE} = V_{IH}$.
- 19. If \overline{CE} goes HIGH simultaneously with \overline{WE} HIGH, the output remains in a high impedance state.
- 20. During this period, the I/Os are in output state and input signals should not be applied.

Notes

- 21. The internal write time of the memory is defined by the overlap of $\overline{\text{CE}}$ LOW and $\overline{\text{WE}}$ LOW. Both signals must be LOW to initiate a write and either signal can terminate a write by going HIGH. The data input set-up and hold timing should be referenced to the rising edge of the signal that terminates the write.
- 22. Data I/O is high impedance if $\overline{\text{OE}} = V_{\text{IH}}$.
- 23. If $\overline{\text{CE}}$ goes HIGH simultaneously with $\overline{\text{WE}}$ HIGH, the output remains in a high impedance state.
- 24. The minimum write cycle time for write cycle No. 3 ($\overline{\text{WE}}$ Controlled, $\overline{\text{OE}}$ LOW) is the sum of t_{HZWE} and t_{SD} .
- 25. During this period, the I/Os are in output state and input signals should not be applied.
