

MICROCHIP

**dsPIC33C Digital Power
Starter Kit
User's Guide**

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

Trademarks

The Microchip name and logo, the Microchip logo, Adaptec, AnyRate, AVR, AVR logo, AVR Freaks, BesTime, BitCloud, chipKIT, chipKIT logo, CryptoMemory, CryptoRF, dsPIC, FlashFlex, flexPWR, HELDO, IGLOO, JukeBlox, KeeLoq, Klear, LANCheck, LinkMD, maXStylus, maXTouch, MediaLB, megaAVR, Microsemi, Microsemi logo, MOST, MOST logo, MPLAB, OptoLyzer, PackeTime, PIC, picoPower, PICSTART, PIC32 logo, PolarFire, Prochip Designer, QTouch, SAM-BA, SenGenuity, SpyNIC, SST, SST Logo, SuperFlash, Symmetricom, SyncServer, Tachyon, TempTracker, TimeSource, tinyAVR, UNI/O, Vectron, and XMEGA are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

dsPIC33C Digital Power Starter Kit User's Guide

NOTES:

dsPIC33C DIGITAL POWER STARTER KIT USER'S GUIDE

Preface

NOTICE TO CUSTOMERS

All documentation becomes dated, and this manual is no exception. Microchip tools and documentation are constantly evolving to meet customer needs, so some actual dialogs and/or tool descriptions may differ from those in this document. Please refer to our website (www.microchip.com) to obtain the latest documentation available.

Documents are identified with a “DS” number. This number is located on the bottom of each page, in front of the page number. The numbering convention for the DS number is “DSXXXXXXXXA”, where “XXXXXXXX” is the document number and “A” is the revision level of the document.

For the most up-to-date information on development tools, see the MPLAB® IDE online help. Select the Help menu, and then Topics to open a list of available online help files.

INTRODUCTION

This chapter contains general information that will be useful to know before using the dsPIC33C Digital Power Starter Kit. Items discussed in this chapter include:

- [Document Layout](#)
- [Conventions Used in this Guide](#)
- [Recommended Reading](#)
- [The Microchip Website](#)
- [Product Change Notification Service](#)
- [Customer Support](#)
- [Document Revision History](#)

DOCUMENT LAYOUT

This user's guide provides an overview of the dsPIC33C Digital Power Starter Kit. The document is organized as follows:

- [Chapter 1. “Introduction”](#) – This chapter introduces the dsPIC33C Digital Power Starter Kit and provides a brief overview of its features.
- [Appendix A. “Board Layout and Schematics”](#) – This appendix provides diagrams of the hardware layout, as well as schematic diagrams for the dsPIC33C Digital Power Starter Kit.
- [Appendix B. “Bill of Materials \(BOM\)”](#) – This appendix presents the Bill of Materials for the dsPIC33C Digital Power Starter Kit.
- [Appendix C. “Demonstration Program Operation”](#) – This chapter describes the demonstration software that is preloaded on the device that accompanies the dsPIC33C Digital Power Starter Kit.

dsPIC33C Digital Power Starter Kit User's Guide

CONVENTIONS USED IN THIS GUIDE

This manual uses the following documentation conventions:

DOCUMENTATION CONVENTIONS

Description	Represents	Examples
Arial font:		
Italic characters	Referenced books	<i>MPLAB[®] IDE User's Guide</i>
	Emphasized text	...is the <i>only</i> compiler...
Initial caps	A window	the Output window
	A dialog	the Settings dialog
	A menu selection	select Enable Programmer
Quotes	A field name in a window or dialog	"Save project before build"
Underlined, italic text with right angle bracket	A menu path	<u><i>File>Save</i></u>
Bold characters	A dialog button	Click OK
	A tab	Click the Power tab
N'Rnnnn	A number in verilog format, where N is the total number of digits, R is the radix and n is a digit.	4'b0010, 2'hF1
Text in angle brackets < >	A key on the keyboard	Press <Enter>, <F1>
Courier New font:		
Plain Courier New	Sample source code	#define START
	Filenames	autoexec.bat
	File paths	c:\mcc18\h
	Keywords	_asm, _endasm, static
	Command-line options	-Opa+, -Opa-
	Bit values	0, 1
	Constants	0xFF, 'A'
Italic Courier New	A variable argument	<i>file.o</i> , where <i>file</i> can be any valid filename
Square brackets []	Optional arguments	mcc18 [options] <i>file</i> [options]
Curly brackets and pipe character: { }	Choice of mutually exclusive arguments; an OR selection	errorlevel {0 1}
Ellipses...	Replaces repeated text	var_name [, var_name...]
	Represents code supplied by user	void main (void) { ... }

RECOMMENDED READING

This user's guide describes how to use the dsPIC33C Digital Power Starter Kit. Other useful document(s) are listed below. The following Microchip document(s) are recommended as supplemental reference resources.

MPLAB[®] C Compiler for PIC24 MCUs and dsPIC[®] DSCs User's Guide (DS51284)

This comprehensive guide describes the usage, operation and features of Microchip's MPLAB C compiler (formerly MPLAB C30) for use with 16-bit devices.

MPLAB[®] X IDE User's Guide (DS50002027)

This document describes how to set up the MPLAB X IDE software and use it to create projects and program devices.

Readme Files

For the latest information on using the dsPIC33C Digital Power Starter Kit board, read the `Readme.txt` text file in the `Readme` subdirectory of the MPLAB X IDE installation directory from the dsPIC33C Digital Power Starter Kit code example. The Readme file contains updated information and known issues that may not be included in this user's guide.

dsPIC33 'CK' Data Sheet

Refer to these documents for detailed information on the dsPIC33 'CK' SMPS Digital Signal Controllers (DSCs). Reference information found in these data sheets includes:

- Device memory maps
- Device pinout and packaging details
- Device electrical specifications
- List of peripherals included on the devices

dsPIC33/PIC24 Family Reference Manual Sections

Family Reference Manual (FRM) sections are available, which explain the operation of the dsPIC[®] DSC and PIC[®] MCU family architecture and peripheral modules. The specifics of each device family are discussed in the individual family's device data sheet.

Microchip SMPS Resources

- AN1114, "*Switch Mode Power Supply (SMPS) Topologies (Part I)*" (DS01114)
- AN1207, "*Switch Mode Power Supply (SMPS) Topologies (Part II)*" (DS01207)
- TB062, "*Frequently Asked Questions (FAQs) About dsPIC[®] DSC SMPS Devices*" (DS93062)

To obtain any of these documents, visit the Microchip website at www.microchip.com.

dsPIC33C Digital Power Starter Kit User's Guide

THE MICROCHIP WEBSITE

Microchip provides online support via our website at www.microchip.com. This website is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the website contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQs), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events; and listings of Microchip sales offices, distributors and factory representatives

PRODUCT CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip website at www.microchip.com, click on **Product Change Notification** and follow the registration instructions.

CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Corporate Application Engineer (CAE)
- Embedded Solutions Engineer (ESE)
- Field Application Engineer (FAE)

Customers should contact their distributor, representative or Embedded Solutions Engineer (ESE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the website at:

<http://www.microchip.com/support>.

DOCUMENT REVISION HISTORY

Revision A (April 2019)

This is the initial release of this document.

Revision B (June 2019)

- Revised [Section 1.4 "Powering the Board"](#).

Chapter 1. Introduction

This chapter introduces the dsPIC33C Digital Power Starter Kit and provides an overview of its features. The topics covered include:

- [Overview](#)
- [Kit Contents](#)
- [Components](#)
- [Powering the Board](#)
- [Electrical Specifications](#)
- [Hardware Description](#)
- [Starter Kit Functionality and Features](#)
- [dsPIC33C Digital Power Starter Kit System Diagram](#)

1.1 OVERVIEW

Modern power supplies are becoming smaller, more efficient, more flexible and less expensive. These desirable enhancements have come about as Digital Signal Controllers (DSCs) are incorporated into Switch Mode Power Supply (SMPS) designs. The board provided in the kit is intended to introduce and demonstrate the capabilities and features of the Microchip SMPS families of devices. The dsPIC33C Digital Power Starter Kit features an on-board dsPIC33CK256MP505 DSC device, SMPS power stages, resistive loads, LCD display, USB/UART bridge, and includes a programmer/debugger, which eliminates the need for any additional hardware.

The software for the demonstration application that is preprogrammed into the on-board dsPIC33C Digital Signal Controller (DSC) is available for download from the Microchip website at: <http://www.microchip.com>.

Note: Refer to the Readme file provided with the dsPIC33C Digital Power Starter Kit demonstration software for instructions on how to run the demonstration application. Refer to the Information Sheet that is provided with the starter kit package for additional resources and instructions on how to use the starter kit for programming and debugging application software.

1.2 KIT CONTENTS

The dsPIC33C Digital Power Starter Kit contains the following:

- dsPIC33C Digital Power Starter Kit Board
- 9V Power Supply
- USB Cable

Note: If you are missing any part of the kit, contact a Microchip sales office for assistance. A list of worldwide Microchip offices for sales and service is provided at the end of this document.

dsPIC33C Digital Power Starter Kit User's Guide

1.3 COMPONENTS

1.3.1 Top and Bottom View

The top and bottom assembly of the board are shown in [Figure 1-1](#) and [Figure 1-2](#). [Table 1-1](#) and [Table 1-2](#) provide a description of the components.

FIGURE 1-1: dsPIC33C DIGITAL POWER STARTER KIT (TOP VIEW)

dsPIC33C Digital Power Starter Kit User's Guide

1.4 POWERING THE BOARD

The dsPIC33C Digital Power Starter Kit is designed to be a self-contained power supply. On-board power stages are:

- One Asynchronous Boost Converter Power Stage
- One Synchronous Buck Converter Power Stage

To power the board, use connectors J1 and/or J6 as follows:

- +9V power connector (J1) supplies power to the dsPIC33C Digital Power Starter Kit, which includes: power stages and auxiliary power supply. Therefore, all building blocks on the board are powered by applying voltage ($> 6V$) at this input. Once the voltage is provided to this connector, the power conversion starts immediately.
- USB connection jack (J6) supplies power to the auxiliary supply, and connection to the USB/UART bridge and PKOB (programmer/debugger), making it possible to communicate, program and debug the microcontrollers on the board without powering the Buck/Boost Converters.

Note: Buck and Boost Converters are both operated in Peak Current mode (default), but can also be reprogrammed to operate in Average Current mode or Voltage mode control; this requires minor firmware and/or hardware changes as different sensing source signals are used.
Powering the board via a USB connector using a +5V only supply (without USB communication connections), such as wall chargers or USB power banks, is currently not supported. With a power supply with non-communication ports, the USB PICKit™ On-Board 4 (PKOB4) debugger/programmer will hold the target device in Reset.

1.5 ELECTRICAL SPECIFICATIONS

TABLE 1-3: DC INPUT RATING (J1)

Parameter	Minimum	Typical	Maximum	Unit
Voltage	6.0	9	13.8	V
Current	—	0.9	—	A

TABLE 1-4: BUCK CONVERTER ELECTRICAL SPECIFICATIONS

Parameter	Minimum	Typical	Maximum	Unit
Output Voltage (default programmed)	—	3.3	—	V
Output Voltage (programmable range)	1	—	3.8	V
Output Voltage Ripple	—	—	40	mV (pk-pk)
Output Current	—	1	2	A
Load Regulation: V _{OUT} = 3.3V, I _{OUT} = 0.1 – 1.0A, V _{IN} = 9V	—	13	—	mV/A
Switching Frequency	—	500	—	kHz
Output Power	—	3.3 ⁽¹⁾	7.6 ⁽²⁾	W

Note 1: Maximum power of on-board resistive loads should not exceed 3.3W.

2: Can be achieved only with an external load.

TABLE 1-5: BOOST CONVERTER ELECTRICAL SPECIFICATIONS

Parameter	Minimum	Typical	Maximum	Unit
Output Voltage (default programmed)	—	15	—	V
Output Voltage (programmable range)	10 ⁽³⁾	—	17.8	V
Output Voltage Ripple	—	10	—	mV (pk-pk)
Output Current	—	0.2	0.4	A
Load Regulation: V _{OUT} = 15V, I _{OUT} = 0.03 – 0.2A, V _{IN} = 9V	—	4	—	mV/A
Switching Frequency	—	500	—	kHz
Output Power	—	3 ⁽¹⁾	6 ⁽²⁾	W

Note 1: Maximum power of on-board resistive loads should not exceed 3W.

2: Can be achieved only with external load.

3: Input voltage must always be lower than the output voltage.

dsPIC33C Digital Power Starter Kit User's Guide

1.6 HARDWARE DESCRIPTION

Topics covered in this section include:

- [Signal Configuration](#)
- [Board Connectors](#)
- [Indicators and Human Interfaces](#)
- [Test Points](#)

1.6.1 Signal Configuration

Table 1-6 provides a full list of the dsPIC33C DSC connections and a brief functional description of the pins used in the dsPIC33C Digital Power Starter Kit.

TABLE 1-6: dsPIC33C CONFIGURATION DETAILS

dsPIC33C Digital Power Starter Kit Signal Label	Pin Number	Device Pin Name	Description/Function
RB14_PWM1H_BUCK	1	RB14	Buck Converter High Drive Signal
RB15_PWM1L_BUCK	2	RB15	Buck Converter Low Drive Signal
RC12_RP60_UART1_TX	3	RC12	USB/Serial Communication Output Pin
RC13_RP61_UART1_RX	4	RC13	USB/Serial Communication Input Pin
SW_RESET	5	$\overline{\text{MCLR}}$	Master Clear (Reset) Input
—	6	RD13	Not Used

1.6.2 Board Connectors

Table 1-7 describes the hardware connections available on the dsPIC33C Digital Power Starter Kit.

TABLE 1-7: HARDWARE CONNECTIONS

Label	Hardware Element Description
J1	9V power supply.
J2	Terminal block for Buck Converter output; can be used for external load.
J3	Terminal block for Boost Converter output; can be used for external load.
J5	Unpopulated header for external programmer/debugger targeting the dsPIC® device.
J6	Micro-USB connector for communication and programming/debugging.
J7	Unpopulated header for external programmer/debugger targeting the PIC24F device.

dsPIC33C Digital Power Starter Kit User's Guide

1.6.3 Indicators and Human Interfaces

Table 1-8 describes the user interfaces available on the dsPIC33C Digital Power Starter Kit.

TABLE 1-8: INDICATORS AND HUMAN INTERFACES

Label	Hardware Element Description
LCD1	User-Programmable LCD Display
LD1	Power-on Status LED, which indicates that the dsPIC33C Digital Power Starter Kit is powered by the 9V supply
LD2	Power-on Status LED, which indicates that the dsPIC33C Digital Power Starter Kit is powered by the USB supply
LD5	User-Programmable LED
LD10, LD11, LD12	Buck Converter Load LEDs
LD13, LD14, LD15	Boost Converter Load LEDs
LD16	Buck Converter Error
LD17	Boost Converter Error
LD18	Thermal Error or Warning
S1	dsPIC [®] Device Reset Push Button
S2	User Push Button
S10	Buck Load Control Push Button
S11	Boost Load Control Push Button

1.6.4 Test Points

Table 1-9 describes the test points that are available on the dsPIC33C Digital Power Starter Kit.

TABLE 1-9: TEST POINTS

Test Point	Description
TP1	+9V DPSK Board Input Voltage (red)
TP10	Buck Low-Side MOSFET Gate (via)
TP11	Switching Node of the Buck Converter
TP12	Buck Output Node (red)
TP13	Ground
TP20	Boost MOSFET Gate
TP21	Switching Node of the Boost Converter
TP22	Boost Output Node (red)
TP23	Ground
TP3	Input Voltage into the 3.3V LDO
TP30	PWM1L Drive Signal Buck Low (yellow)

TP48	OA3 Output
TP49	Boost CS/OA2 Output
TP50	DSP_GPIO1
TP51	DSP_GPIO2
TP52	DSP_GPIO3
TP53	DSP_GPIO4
TP60	Buck OVP Comparator
TP61	Boost OVP Comparator
TP62	Buck OCP Comparator
TP63	Buck OCP Gate
TP64	Boost OCP
TP65	Boost OCP Gate
TP66	PROT_GPIO2
TP67	PROT_GPIO3
TP68	PROT_GPIO4
TP74	Buck Load 3
TP75	Boost Load 3
TP76	Temperature Sensor

1.7 STARTER KIT FUNCTIONALITY AND FEATURES

The dsPIC33C Digital Power Starter Kit is a Switch Mode Power Supply (SMPS) board that consists of one independent DC/DC synchronous Buck Converter, one independent DC/DC Boost Converter, independent resistive loads, protection circuitry, USB/UART converter/bridge and on-board programmer/debugger circuitry. Both power stages are controlled by the dsPIC33C device. Loads and protection circuitry are controlled by an auxiliary PIC24F microcontroller. The PIC24F microcontroller and the dsPIC33C device communicate over UART, exchanging information, such as: load temperature, load status and protection status. These messages can be adapted or extended by the user.

1.7.1 Buck Converter

The Buck Converter stage is rated for a maximum of 7.6W. However, the maximum on-board configurable resistive load is 3.3W. The output voltage and output current should remain within their Safe Operating Area (SOA) to avoid protection circuitry tripping. The output voltage of the Buck Converter (Buck_Out) can be programmed from a 1V to 3.8V output, with a default programmed voltage of 3.3V. The hardware gain, $1k/(1k + 1k + 20)$, of the voltage feedback from the Buck_Out is provided by the resistor divider network, R62 and R63. Additionally, a 20 Ohm resistor, R60, for bode plot measurements is also in series with the feedback network. The hardware gain of the current feedback is provided by the Current Transformer (T1) with turns ratio (1:100) and burden resistor, R14. In total, this voltage will have a gain of 1V/Amp.

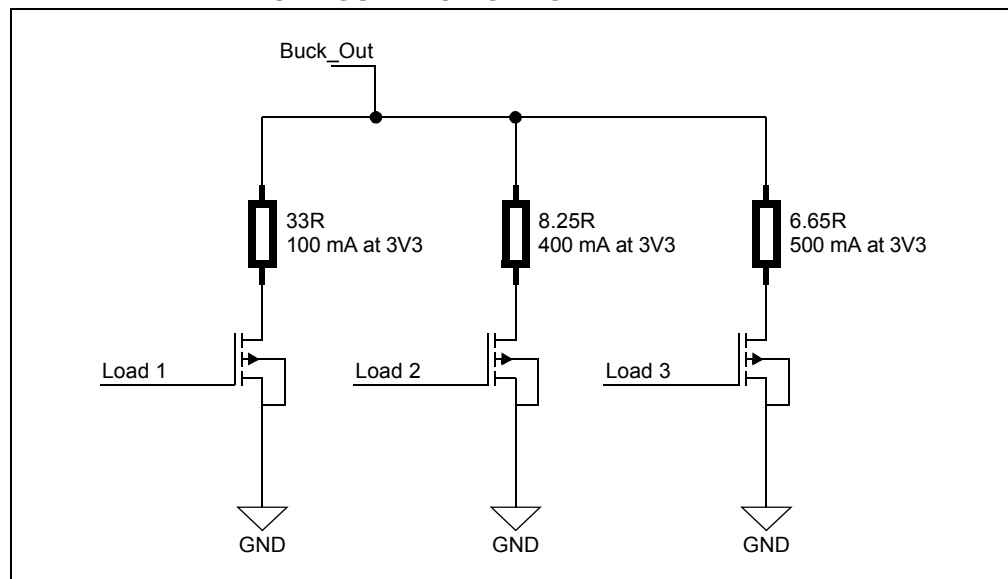

Figure 1-3 shows the load configuration. The load consists of three parallel resistor networks, with each network having its own equivalent resistance, as indicated in Figure 1-3. Therefore, each network will draw different current and dissipate different power at different output voltages. The board is supplied with pre-programmed 3.3V at the buck output with 3.3W load. The power dissipation causes 40°C ΔT on the board.

Note: With current firmware supported by the auxiliary PIC24F microcontroller, the following options are possible to operate the loads: 0% (no load), 10%, 50%, 100% load (1A max). Press the push button, "Buck Load" (No. 6 in Figure 1-1), shortly to increase the load. In addition, the LEDs (LD10, 11 and 12) will turn on to signalize the load status. Once 100% is reached, pushing the button again will result in jumping to 0%; that is, turning off the load. All LEDs will be off and the process can start from the beginning. The load step generator is working at 100 Hz and 50% duty cycle. The supported load step schema is:

10% → 50%
50% → 100%
10% → 100%

Press and hold push button, "Buck Load", for two seconds in order to change from Static Load to Load Step mode and vice versa.

FIGURE 1-3: BUCK CONVERTER – ON-BOARD RESISTIVE LOAD CONFIGURATION OPTION

1.7.2 Boost Converter

The Boost Converter stage is rated for a maximum power of 6W. However, the maximum on-board configurable resistive load is 3W. The output voltage and output current should remain within the Boost Converter Safe Operating Area (SOA) to avoid damage to the board. The output voltage of the Boost Converter (Boost_Out) can be programmed from a 10V to 17.8V output, with a default programmed voltage of 15V. The hardware gain, $1k/(1k + 6.98k + 20)$, of the voltage feedback from the Boost_Out is provided by the resistor divider network of R72 and R73. Additionally, a 20 Ohm resistor, R71, for bode plot measurements is also in series with the feedback network. The hardware gain of the current feedback is provided by the current sense resistors, R34 and R35, and an internal op amp gain of four. In total, this voltage will have an offset voltage of 1V and a gain of 1V/A.

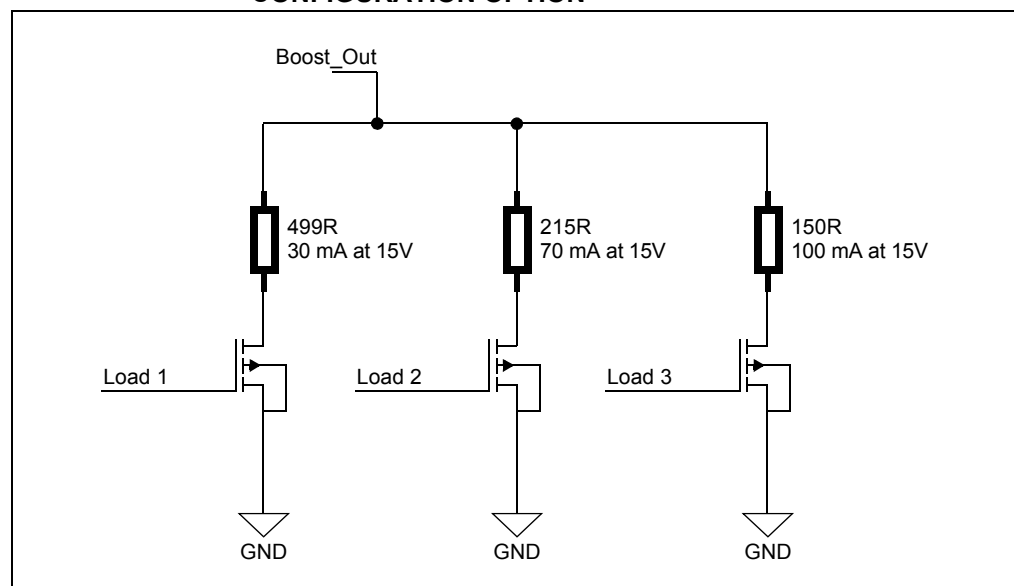

Figure 1-4 shows load configuration. The load consists of three parallel resistor networks with each network having its own equivalent resistance, as indicated in Figure 1-4. Therefore, each network will draw different current and dissipate different power at different output voltages. The board is supplied with pre-programmed 15V at the boost output, with 3W load. The power dissipation causes 40°C ΔT on the board.

Note: With current firmware, supported by the auxiliary PIC24F microcontroller, the following options are possible to operate the loads: 0% (no load), 15%, 50%, 100% load (200 mA max). Press the push button, “Boost Load” (No. 6 in Figure 1-1), shortly to increase the load. In addition, the LEDs (LD13, 14 and 15) will turn on to signalize the load status. Once 100% is reached, pushing the button again will result in jumping to 0%, that is, turning off the load. All LEDs will be off and the process can start from the beginning. The load step generator is working at 100 Hz and 50% duty cycle. The supported load step schema is:

15% → 50%
 50% → 100%
 15% → 100%

Press and hold push button, “Boost Load”, for two seconds in order to change from Static Load to Load Step mode and vice versa.

FIGURE 1-4: BOOST CONVERTER – ON-BOARD RESISTIVE LOAD CONFIGURATION OPTION

dsPIC33C Digital Power Starter Kit User's Guide

1.7.3 Additional Features

- On-Board Temperature Sensor: Located in the area of the resistive loads; this enables the user to program a temperature protection limit and a high-temperature fail-safe shutdown. Temperature threshold levels are as follows:
 - 65°C: Warning; LD18 (overheat) is permanently on
 - 75°C: LD18 (overheat) is blinkingPlease note that under this condition, the loads will permanently be switched off until the board temperature drops to the Safe Operating Area of < 65°C.

Note: Taking into account the physical dimensions, the ambient temperature, the power dissipation and the protection threshold of the board, there are two possible combinations:

1. Single power stage running at full power, 3.3W maximum.
2. Both power stages running at 50% load.

Running both stages at 100% load would mean 6.3W power dissipation. This will drive the board to an overheat condition after a short period of time (within several minutes).

- Input Voltage Sense: Used to monitor the rail and detect under/overvoltage conditions.
- Input Voltage LED Indicators:
 - LD1: USB voltage indicator
 - LD2: AUX bias voltage indicator
- Load Indication LEDs:
 - LD (10,11,12): Buck Converter loads
 - LD (13,14,15): Boost Converter loads
- Error Indication LEDs:
 - LD 16: Buck Converter error
 - LD 17: Boost Converter error
- On-Board Protection Circuitry is permanently monitoring currents and voltages in the system. Trip levels are adjusted as follow:
 - 3 APEAK Buck Converter input current
 - 4V Buck Converter output voltage
 - 1.6A Boost Converter input current
 - 18V Boost Converter output voltage

Note: Once the signal exceeds the threshold level, the protection circuitry will latch this information and disable the related gate driver. The power flow will stop and the related LED will blink, indicating that a latched Fault occurred. The auxiliary microcontroller will reset this status every second after the Fault event and the related LED will be back to an OFF state.

- LD18: Thermal Error
- Reset Push Button: Press and release this button for the dsPIC device to go through a Reset routine.
- User Push Button: Press this button to change the information page on the LCD.
- On-Board LCD 2x16 Character Display: Shows different system relevant data, such as voltages, currents, temperature, internal load setting and converter status (enabled/disabled). Press push button, "USER" (No. 8 in [Figure 1-1](#)), to jump from one information page to another page.

1.7.4 Programmer/Debugger

The dsPIC33C Digital Power Starter Kit includes an on-board programmer/debugger circuit that provides connectivity over USB. This circuit is hard-wired to the dsPIC[®] DSC device to provide ICSP[™] debugging/programming capability.

TABLE 1-10: PROGRAMMER/DEBUGGER COMPONENTS

Component	Label	Description
On-Board Programmer/Debugger	N/A	Controls the programming/debugging operations of the target dsPIC33C DSC.
Programmer/Debugger USB Connector	J6	Provides power to the programmer/debugger, and bidirectional communication between the host PC and the dsPIC33C Digital Power Starter Kit. For UART communication, a USB/UART hub and bridge are on board, hard-wired to the dsPIC33C device. It is possible to communicate over a UART channel to the PIC24F through the dsPIC33C DSC.

1.8 dsPIC33C DIGITAL POWER STARTER KIT SYSTEM DIAGRAM

The dsPIC33C Digital Power Starter Kit provides Closed-Loop Peak Current mode control using a 2-Pole, 2-Zero (2P2Z) compensator, implemented in software, to maintain the desired load step response and converter stability criteria. The dsPIC DSC device provides the necessary memory and peripherals for ADC conversion, PWM generation, analog comparison and general purpose I/Os, preventing the need to perform these functions in external circuitry.

dsPIC DSC SMPS devices are specifically designed to provide low-cost and efficient control for a wide range of power supply topologies. The specialized peripherals facilitate closed-loop feedback control of Switch Mode Power Supplies, providing communication for remote monitoring and supervisory control.

The dsPIC33C family of devices provides the following features:

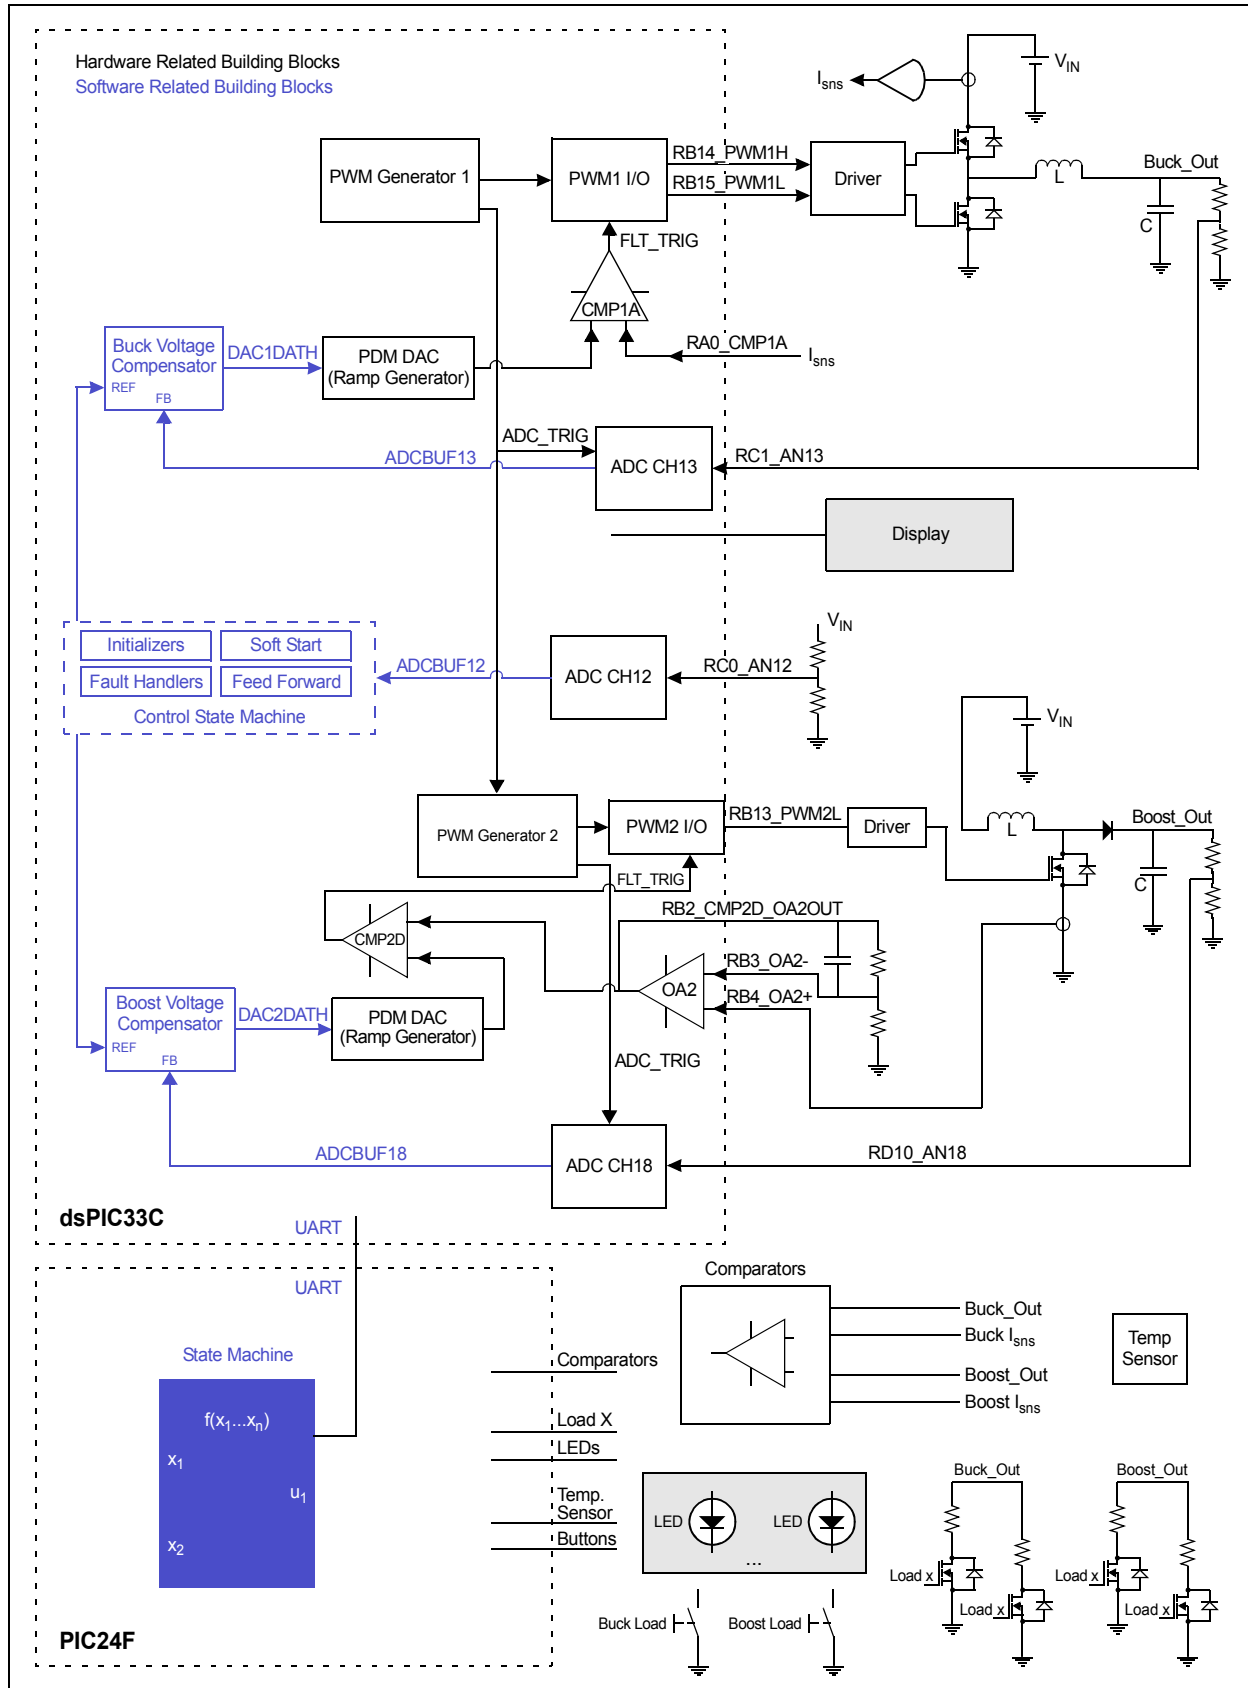

- Integrated program and data memory on a single chip
- Ultra-fast interrupt response time with interrupt priority logic
- High-speed ADC with multiple Sample-and-Hold (S&H) circuits
- High-resolution PWM generators, specially designed to support different power topologies
- High-speed analog comparators for control loop implementation and system protection
- On-chip system communications (I²C/SPI/UART)
- Internal PDM DAC slope compensation
- On-chip Fast RC (FRC) oscillator for lower system cost

Note: Buck and Boost Converters are both operated in Peak Current mode (default), but can also be reprogrammed to operate in Average Current or Voltage mode control; this requires minor firmware and/or hardware changes if different sensing source signals are used.

Appendix C. Demonstration Program Operation

The dsPIC33C device on the dsPIC33C Digital Power Starter Kit is preprogrammed with Peak Current mode control application software that illustrates simultaneous 2-Pole, 2-Zero (2P2Z) compensator control of the output voltage for the two DC/DC Converter circuits. This code can be downloaded from the Microchip website (www.microchip.com).

This section covers the following topics:

- [Program Demonstration](#)
- [Code Demonstration](#)
- [Other Code Examples](#)

C.1 PROGRAM DEMONSTRATION

The demonstration program provides simultaneous closed-loop control of the output voltage for both DC/DC Converter stages of the dsPIC33C Digital Power Starter Kit. The high-level block diagram is shown in [Figure C-1](#) and the program flow chart is shown in [Figure C-2](#).

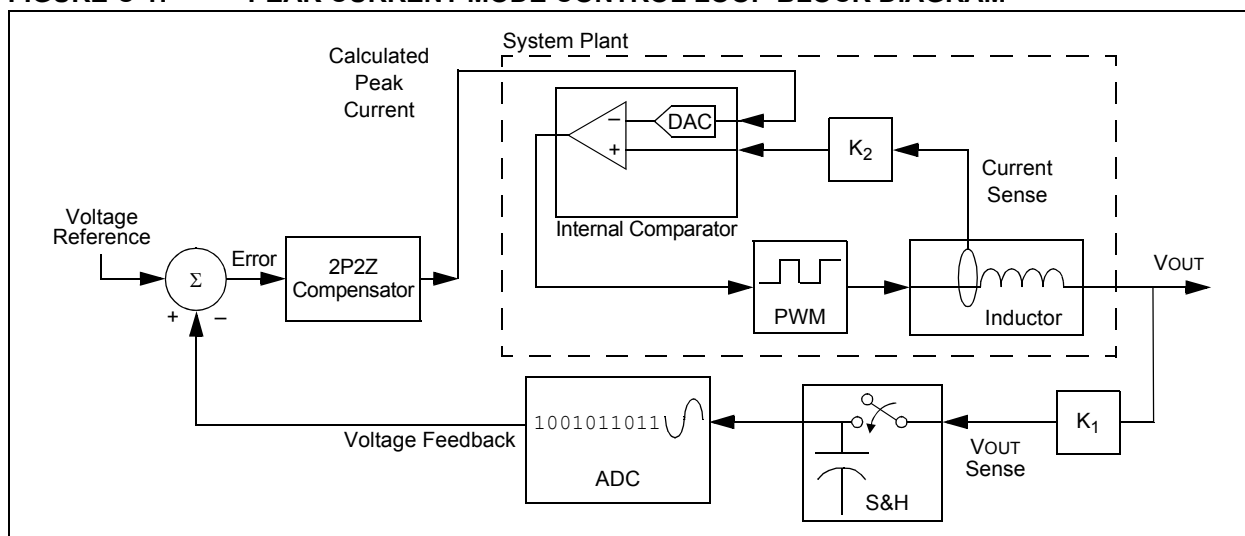

The 2P2Z control loop controls the Buck Converter output voltage to 3.3V and the Boost Converter output voltage to 15V.

The 2P2Z control scheme consists of the following parameters:

- Reference – Desired set point for the output voltage.
- Error – Calculation of (Reference – Feedback). This is the value the compensator acts upon.
- System Plant – This is the converter being controlled.
- Output – Either the output voltage or current.
- Feedback – The measured output signal level.

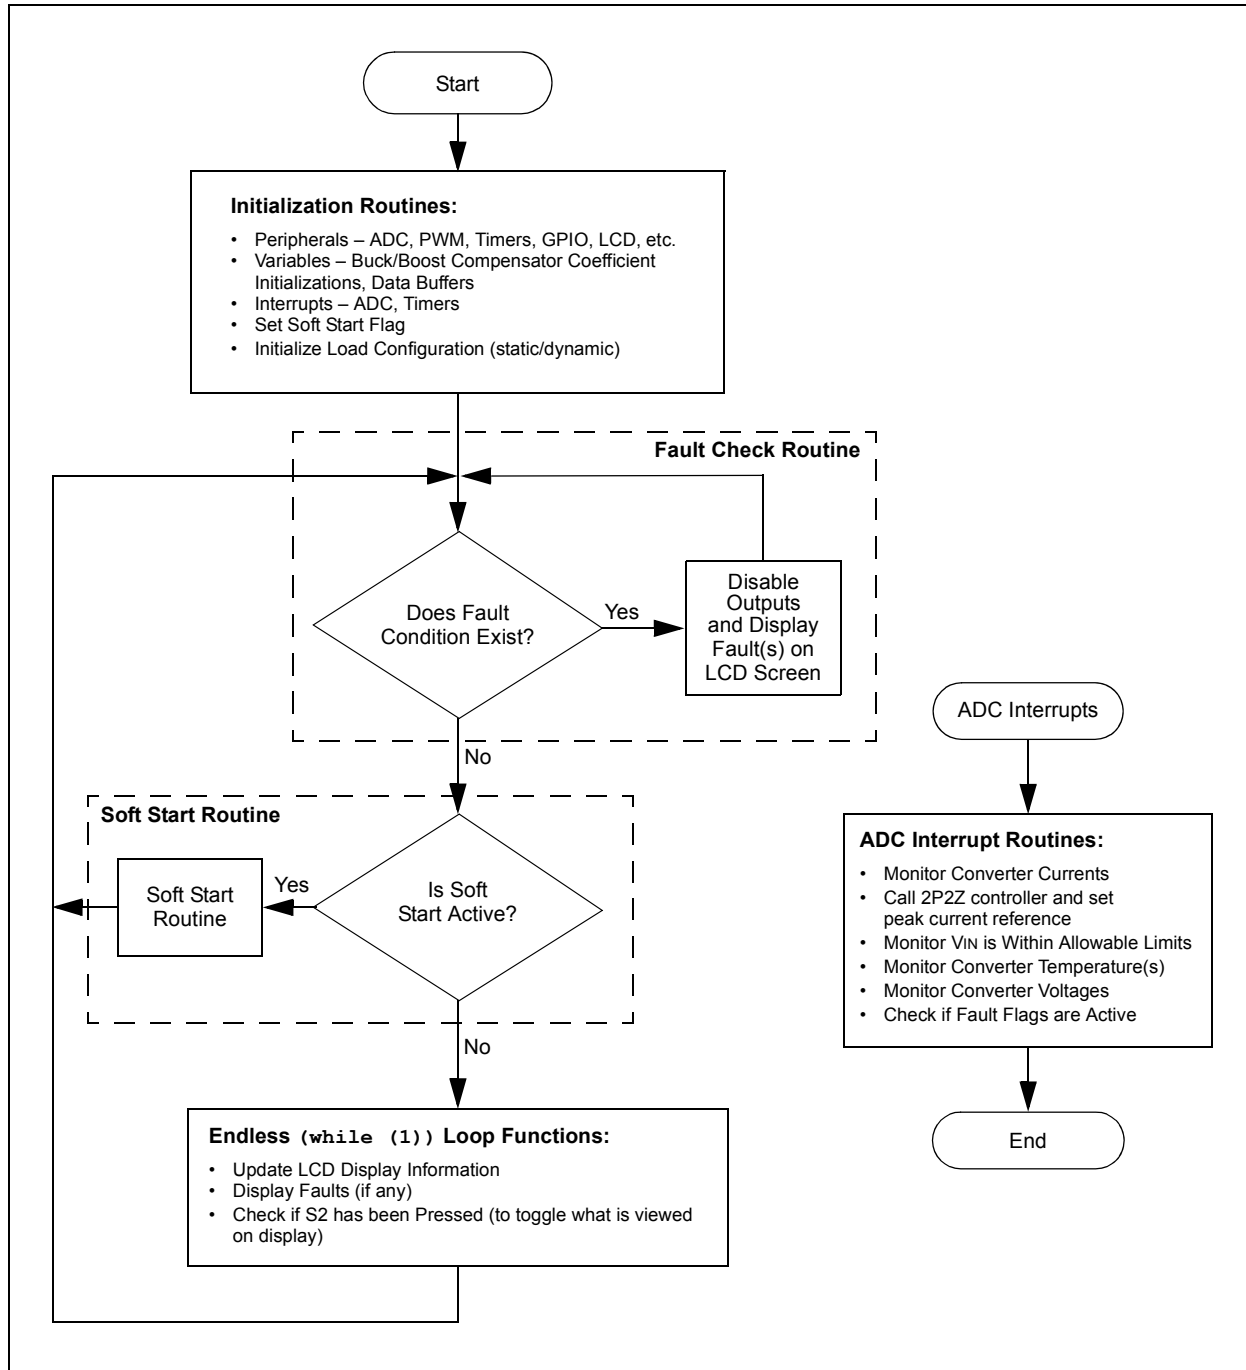

Please refer to [Section C.2.4 “2P2Z SW Control Compensator”](#) for further details. The demonstration program requires no manual preparation, except to connect 9V to the J2 connector.

C.2 CODE DEMONSTRATION

C.2.1 System Initialization

When power is applied to the board, the program starts by executing the following system initialization routines:

- Peripherals – The required peripherals (PWM, ADC, comparators, I²C module, timers and GPIO) are configured and enabled.
- Interrupts – Include ADC(s), timer(s), comparator(s) interrupts.
- Loads – Can be configured for either Static mode or Dynamic mode. If Dynamic mode is selected, a switching frequency can be configured in application SW.

C.2.2 Fault Check

The program checks for any Faults that might have occurred during program operation. The Fault checks include the following:

- Input Over/Undervoltage
- Buck/Boost Converter Overtemperature
- Buck/Boost Soft Start

If any of the listed Faults occur, the corresponding Fault will be shown on the LCD display. The corresponding PWM signals and loads are disabled until the Fault condition has been cleared. Fault checks are dispersed throughout all the interrupts. If no Fault condition is detected, the program proceeds.

C.2.3 Soft Start

The Soft Start routine ramps up the output voltage in a closed-loop fashion until it is at the programmed output voltage value. This routine ensures that the output does not overshoot the desired voltage.

C.2.4 2P2Z SW Control Compensator

The 2-Pole, 2-Zero (2P2Z) Controller, implemented in SW, is the digital implementation of the Analog Type II Controller. This filter maintains regulation of the output voltage and ensures stability during different line/load conditions. This controller requires three feedback errors, multiplied by their associated coefficients, plus the two latest controller output values, multiplied by their associated coefficients, along the delay line to provide proper compensation of the power converter. The coefficients are determined externally using simulation tools.

Reference the `smps_2p2z_dspic_v2` source file and `smps_control.h` header files in the DPSK software package for further implementation details.

C.2.5 System `while` (1) Loop

The LCD refresh functions are called within the system Idle routine. The routine refreshes the LCD screen based on both user input (S2) and converter feedback (Fault flags/VIN measurement/converter output voltage). All Fault display updates are performed in the system Idle loop routine, as well as the toggling of the displayed measurements as the results of pressing S2.

C.3 OTHER CODE EXAMPLES

There are several other SMPS code examples available on the Microchip website. Refer to the Readme files located in each code example folder for details on what each code example demonstrates. Check the Microchip website (www.microchip.com/SMPS) for the latest updates to the code examples and for additional code examples.
