[SCDS305D](https://www.ti.com/lit/pdf/SCDS305) – FEBRUARY 2011 – REVISED SEPTEMBER 2022

SN74GTL2003 8-Bit Bidirectional Low-Voltage Translator

1 Features

- Provides bidirectional voltage translation with no direction control required
- Allows voltage level translation from 0.95 V up to 5 V
- Provides direct interface with GTL, GTL+, LVTTL/ TTL, and 5-V CMOS levels
- Supports 50 MHz up or down translation at ≦20 pF capacitive load
- Low ON-state resistance between input and output pins (Sn/Dn)
- Supports hot insertion
- No power supply required will not latch up
- 5-V-tolerant inputs
- Low standby current
- Flow-through pinout for ease of printed circuit board trace routing

2 Applications

- Bidirectional or unidirectional applications requiring voltage-level translation from any voltage (0.95 V to 5 V) to any voltage (0.95 V to 5 V)
- Low voltage processor I^2C port translation to 3.3-V or 5-V $1²C$ bus signal levels
- GTL/GTL+ translation to LVTTL/TTL signal levels
- HPC server
- [Dialysis machines](https://www.ti.com/solution/dialysis-machine?variantid=33754)
- [Service router](https://www.ti.com/solution/small-business-router?variantid=35138)
- **[Servers](https://www.ti.com/applications/enterprise-systems/datacenter-enterprise-computing/overview.html)**

3 Description

The SN74GTL2003 device provides eight NMOS pass transistors (Sn and Dn) with a common gate (G_{REF}) and a reference transistor (S_{REF} and D_{REF}). The low ON-state resistance of the switch allows connections to be made with minimal propagation delay. With no direction control pin required, the device allows bidirectional voltage translations any voltage (0.95 V to 5 V) to any voltage $(0.95 V)$ to 5 V).

All transistors in the SN74GTL2003 have the same electrical characteristics, and there is minimal deviation from one output to another in voltage or propagation delay. This offers superior matching over discrete transistor voltage-translation solutions where the fabrication of the transistors is not symmetrical. With all transistors being identical, the reference transistor (S_{REF}/D_{REF}) can be located on any of the other eight matched Sn/Dn transistors, allowing for easier board layout. The translator transistors with integrated ESD circuitry provides excellent ESD protection.

Package Information(1)

6 Specifications 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted) (1)

(1) $V_{SREF} = V_{DREF} - 1.5 V$ for best results in level-shifting applications.

6.4 Thermal Information

(1) For more information about traditional and new thermal metrics, see the *[Semiconductor and IC Package Thermal Metrics](https://www.ti.com/lit/pdf/spra953)* application report.

6.5 Electrical Characteristics

over recommended operating free-air temperature range, $V_{CC} = 3.3 V \pm 0.3 V$ (unless otherwise noted)

(1) All typical values are measured at $T_A = 25^{\circ}$ C.
(2) Measured by the voltage drop between the Si

Measured by the voltage drop between the Sn and the Dn terminals at the indicated current through the switch. ON-state resistance is determined by the lowest voltage of the two (Sn or Dn) terminals.

6.6 Switching Characteristics

V $_{\rm{REF}}$ = 1.365 V to 1.635 V, V $_{\rm{DD1}}$ = 3 V to 3.6 V, V $_{\rm{DD2}}$ = 2.36 V to 2.64 V, GND = 0 V, t_r = t_f ≤ 3 ns, T_A = –40°C to +85°C (see [Figure 9-1\)](#page-9-0)⁽¹⁾

(1) $C_{ON(max)}$ of 30 pF and a $C_{OFF(max)}$ of 15 pF is specified by design.

(2) All typical values are measured at V_{DD1} = 3.3 V, V_{DD2} = 2.5 V, V_{REF} = 1.5 V and T_A = 25°C.
(3) Propagation delay specified by characterization.

Propagation delay specified by characterization.

6.7 Switching Characteristics

 V_{GREF} = 5 V ± 0.5 V, GND = 0 V, T_A = -40° C to +85 $^{\circ}$ C

(see [Figure 9-1\)](#page-9-0)

(1) This parameter is warranted but not production tested. The propagation delay is based on the RC time constant of the typical ON-state resistance of the switch and a load capacitance of 50 pF, when driven by a voltage source with zero output impedance.

8 Detailed Description

8.1 Overview

The SN74GTL2003 device provides eight NMOS pass transistors (Sn and Dn) with a common gate (G_{RFF}) and a reference transistor (S_{REF} and D_{REF}). The low ON-state resistance of the switch allows connections to be made with minimal propagation delay. With no direction control pin required, the device allows bidirectional voltage translations from any voltage (0.95 V to 5 V) to any voltage (0.95 V to 5 V).

When the Sn or Dn port is LOW, the clamp is in the ON state and a low-resistance connection exists between the Sn and Dn ports. Assuming the higher voltage is on the Dn port, when the Dn port is HIGH, the voltage on the Sn port is limited to the voltage set by the reference transistor (S_{RFF}) . When the Sn port is HIGH, the Dn port is pulled to VCC by the pullup resistors.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Provides Bidirectional Voltage Translation With No Direction Control Required

Because the circuit acts essentially as a pass transistor, no direction pin is needed, as data is allowed to flow both ways.

8.3.2 Flow Through Pinout

Allocated pins for input and output A on right side and input and output B on left side. Reduces the need for multi-layer board layout or long traces through the system.

8.4 Device Functional Modes

Table 8-1. High to Low Translation (Assuming Dn is at the Higher Voltage Level)

 H H | V $_{\mathsf{TT}}$ (2) | V $_{\mathsf{TT}}$ | H⁽³⁾ | Nearly Off H | H | V_{TT} | L | L⁽⁴⁾ | On L | L | 0 – V_{TT} | X | X | Off

(1) G_{REF} should be at least 1.5 V higher than S_{REF} for best translator operation.
(2) V_{TT} is equal to the S_{REF} voltage.

(2) \quad V_{TT} is equal to the S_{REF} voltage.

(3) Dn is pulled up to VCC through an external resistor.

(4) Dn follows the Sn input LOW.

9 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1 Application Information

SN74GTL2003 is a GTL/GTL+ to LVTTL/TTL bidirectional voltage level translator. This device can be used in both unidirectional applications and bidirectional. Please find the reference schematics and recommended values for passive components in *Section 9.2*.

9.2 Typical Applications

9.2.1 Bidirectional Translation

For the bidirectional clamping configuration (higher voltage to lower voltage or lower voltage to higher voltage), the G_{REF} input must be connected to D_{REF} and both pins pulled to HIGH-side V_{CC} through a pullup resistor (typically 200 kΩ). TI recommends a filter capacitor on D_{REF}. The processor output can be totem pole or open drain (pullup resistors) and the chipset output can be totem pole or open drain (pullup resistors are required to pull the Dn outputs to V_{CC}). However, if either output is totem pole, data must be unidirectional or the outputs must be 3-statable, and the outputs must be controlled by some direction-control mechanism to prevent HIGH-to-LOW contentions in either direction. If both outputs are open drain, no direction control is needed. The opposite side of the reference transistor (S_{REF}) is connected to the processor core power-supply voltage. When D_{REF} is connected through a 200-kΩ resistor to a 3.3-V to 5.5-V VCC supply and S_{REF} is set from 1 V to V_{CC} 1.5 V, the output of each Sn has a maximum output voltage equal to S_{REF} , and the output of each Dn has a maximum output voltage equal to V_{CC} .

9.2.1.1 Design Requirements

- SN74GTL2003 requires industry standard GTL and LVTTL/TTL voltage levels.
- Place pullup resistors of \approx 200 kΩ in all inputs/outputs to the GTL/TTL voltage levels.
- Place 0.1-μF bypass capacitors close to the power supply pins to reduce errors coupling in from noisy or high-impedance power supplies.
- Comply to the parameters in *[Section 6.3](#page-3-0)*.

9.2.1.2 Detailed Design Procedure

9.2.1.2.1 Sizing Pullup Resistors

The pullup resistor value should limit the current through the pass transistor when it is in the on state to about 15 mA. This ensures a pass voltage of 260 mV to 350 mV. If the current through the pass transistor is higher than 15 mA, the pass voltage also is higher in the on state. To set the current through each pass transistor at 15 mA, the pullup resistor value is calculated as:

Resistor value
$$
(\Omega)
$$
 = $\frac{\text{Pullup voltage}(V) - 0.35 V}{0.015 A}$ (1)

Table 9-1 provides resistor values for various reference voltages and currents at 15 mA, 10 mA, and 3 mA. The resistor value shown in the +10% column, or a larger value, should be used to ensure that the pass voltage of the transistor would be 350 mV or less. The external driver must be able to sink the total current from the resistors on both sides of the GTL device at 0.175 V, although the 15 mA only applies to current flowing through the SN74GTL2003.

Table 9-1. Pullup Resistor Values(1) (2) (3) (4)

(1) $H = HIGH$ voltage level, $L = LOW$ voltage level, $X = do$ not care.

(2) Calculated for $V_{OL} = 0.35$ V

(3) Assumes output driver $V_{OL} = 0.175$ V at stated current

 (4) +10% to compensate for V_{DD} range and resistor tolerance

9.2.1.3 Application Curve

Figure 9-2. Signal Voltage vs Time (ps) (Simulated Design Results)

9.2.2 Unidirectional Down Translation

For unidirectional clamping (higher voltage to lower voltage), the G_{REF} input must be connected to D_{REF} and both pins pulled to the higher-side V_{CC} through a pullup resistor (typically 200 kΩ). TI recommends a filter capacitor on D_{REF} . Pullup resistors are required if the chipset I/Os are open drain. The opposite side of the reference transistor (S_{REF}) is connected to the processor core power supply voltage. When D_{REF} is connected through a 200-kΩ resistor to a 3.3-V to 5.5-V V_{CC} supply and S_{REF} is set from 1 V to V_{CC} – 1.5 V, the output of each Sn has a maximum output voltage equal to S_{REF} .

9.2.2.1 Design Requirements

- SN74GTL2003 requires industry standard GTL and LVTTL/TTL voltage levels.
- Place pullup resistors of \approx 200 kΩ in all inputs/outputs to the GTL/TTL voltage levels.
- Place 0.1-μF bypass capacitors close to the power supply pins to reduce errors coupling in from noisy or high-impedance power supplies.
- Comply to the parameters in *[Section 6.3](#page-3-0)*.

9.2.2.2 Detailed Design Procedure

9.2.2.2.1 Sizing Pullup Resistors

The pullup resistor value should limit the current through the pass transistor when it is in the on state to about 15 mA. This ensures a pass voltage of 260 mV to 350 mV. If the current through the pass transistor is higher than 15 mA, the pass voltage also is higher in the on state. To set the current through each pass transistor at 15 mA, the pullup resistor value is calculated as:

Resistor value
$$
(\Omega)
$$
 = $\frac{\text{Pullup voltage}(V) - 0.35 V}{0.015 A}$ (2)

Table 9-2 provides resistor values for various reference voltages and currents at 15 mA, 10 mA, and 3 mA. The resistor value shown in the +10% column, or a larger value, should be used to ensure that the pass voltage of the transistor would be 350 mV or less. The external driver must be able to sink the total current from the resistors on both sides of the GTL device at 0.175 V, although the 15 mA only applies to current flowing through the SN74GTL2003.

Table 9-2. Pullup Resistor Values^{(1) (2) (3) (4)}

(1) $H = HIGH$ voltage level, $L = LOW$ voltage level, $X = do$ not care.

(2) Calculated for $V_{OL} = 0.35$ V

(3) Assumes output driver $V_{OL} = 0.175$ V at stated current

(4) +10% to compensate for V_{DD} range and resistor tolerance

9.2.3 Unidirectional Up Translation

For unidirectional up translation (lower voltage to higher voltage), the reference transistor is connected the same as for a down translation. A pullup resistor is required on the higher voltage side (Dn or Sn) to get the full HIGH level, because the GTL device only passes the reference source (S_{REF}) voltage as a HIGH when doing an up translation. The driver on the lower voltage side only needs pullup resistors if it is open drain.

9.2.3.1 Design Requirements

- SN74GTL2003 requires industry standard GTL and LVTTL/TTL voltage levels.
- Place pullup resistors of \approx 200 kΩ in all inputs/outputs to the GTL/TTL voltage levels.
- Place 0.1-μF bypass capacitors close to the power supply pins to reduce errors coupling in from noisy or high-impedance power supplies.
- Comply to the parameters in *[Section 6.3](#page-3-0)*

9.2.3.2 Detailed Design Procedure

9.2.3.2.1 Sizing Pullup Resistors

The pullup resistor value should limit the current through the pass transistor when it is in the on state to about 15 mA. This ensures a pass voltage of 260 mV to 350 mV. If the current through the pass transistor is higher than 15 mA, the pass voltage also is higher in the on state. To set the current through each pass transistor at 15 mA, the pullup resistor value is calculated as:

Resistor value
$$
(\Omega)
$$
 = $\frac{\text{Pullup voltage}(V) - 0.35 V}{0.015 A}$

Table 9-3 provides resistor values for various reference voltages and currents at 15 mA, 10 mA, and 3 mA. The resistor value shown in the +10% column, or a larger value, should be used to ensure that the pass voltage of the transistor would be 350 mV or less. The external driver must be able to sink the total current from the resistors on both sides of the GTL device at 0.175 V, although the 15 mA only applies to current flowing through the SN74GTL2003.

Table 9-3. Pullup Resistor Value^{[\(1\)](#page-14-0)} [\(2\)](#page-14-0) [\(3\)](#page-14-0) (4)

(3)

Table 9-3. Pullup Resistor Value(1) (2) (3) (4) **(continued)**

(1) H = HIGH voltage level, L = LOW voltage level, X = do not care.

(2) Calculated for V_{OL} = 0.35 V

(3) Assumes output driver $V_{OL} = 0.175$ V at stated current

 (4) +10% to compensate for V_{DD} range and resistor tolerance

10 Power Supply Recommendations

Place 0.1-μF bypass capacitors close to the power supply pins to reduce errors coupling in from noisy or high-impedance power supplies.

11 Layout

11.1 Layout Guidelines

For best operational performance of the device, use good PCB layout practices, including:

- Noise can propagate into analog circuitry through the power pins of the circuit as a whole, as well as the operational amplifier. Bypass capacitors are used to reduce the coupled noise by providing low impedance power sources local to the analog circuitry.
	- Connect low-ESR, 0.1-μF ceramic bypass capacitors between each supply pin and ground, placed as close to the device as possible. A single bypass capacitor from V+ to ground is applicable for single supply applications.
- Separate grounding for analog and digital portions of circuitry is one of the simplest and most-effective methods of noise suppression. One or more layers on multilayer PCBs are usually devoted to ground planes. A ground plane helps distribute heat and reduces EMI noise pickup. Make sure to physically separate digital and analog grounds, paying attention to the flow of the ground current.
- To reduce parasitic coupling, run the input traces as far away from the supply or output traces as possible. If it is not possible to keep them separate, it is much better to cross the sensitive trace perpendicular as opposed to in parallel with the noisy trace.
- Place the external components as close to the device as possible. Keeping RF and RG close to the inverting input minimizes parasitic capacitance.
- Keep the length of input traces as short as possible. Always remember that the input traces are the most sensitive part of the circuit.
- Consider a driven, low-impedance guard ring around the critical traces. A guard ring can significantly reduce leakage currents from nearby traces that are at different potentials.

12 Device and Documentation Support

12.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

12.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com.](https://www.ti.com) Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

12.3 Support Resources

TI E2E™ [support forums](https://e2e.ti.com) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use.](https://www.ti.com/corp/docs/legal/termsofuse.shtml)

12.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.

All trademarks are the property of their respective owners.

12.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

12.6 Glossary

[TI Glossary](https://www.ti.com/lit/pdf/SLYZ022) This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (CI) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
