

MuxIt™ PLL FREQUENCY MULTIPLIER

FEATURES

- A Member of the MuxIt™ Serializer-Deserializer Building-Block Chip Family
- Pin Selectable Frequency Multiplier Ratios Between 4 and 40
- Input Clock Frequencies From 5 to 50 MHz
- Multiplied Clock Frequencies up to 400 MHz
- Internal Loop Filters and Low PLL-Jitter of 20 ps RMS Typical at 200 MHz
- LVDS Compatible Differential Inputs and Outputs Meet or Exceed the Requirements of ANSI EIA/TIA-644-A
- LVTTTL Compatible Inputs Are 5 V Tolerant
- LVDS Inputs and Outputs ESD Protection Exceeds 12 kV HBM
- Operates From a Single 3.3 V Supply
- Packaged in 28-Pin Thin Shrink Small-Outline Package With 26 mil Terminal Pitch

DESCRIPTION

The MuxIt is a family of general-purpose, multiple-chip building blocks for implementing parallel data serializers and deserializers. The system allows for wide parallel data to be transmitted through a reduced number of differential transmission lines over distances greater than can be achieved with a single-ended (e.g., LVTTTL or LVCMOS) data interface. The number of bits multiplexed per transmission line is user selectable, allowing for higher transmission efficiencies than with other existing fixed ratio solutions. MuxIt utilizes the LVDS (TIA/EIA-644) low voltage differential signaling technology for communications between the data source and data destination.

The MuxIt family initially includes three devices supporting simplex communications; *The SN65LVDS150 Phase Locked Loop-Frequency Multiplier*, *The SN65LVDS151 Serializer-Transmitter*, and *The SN65LVDS152 Receiver-Deserializer*.

The SN65LVDS150 is a PLL based frequency multiplier designed for use with the other members of the MuxIt family of serializers and deserializers. The frequency multiplication ratio is pin selectable over a wide range of values from 4 through 40 to accommodate a broad spectrum of user needs. No external filter components are needed. A PLL lock indicator output is available which may be used to enable link data transfers.

The design of the SN65LVDS150 allows it to be used at either the transmit end or the receive end of the MuxIt serial link. The differential clock reference input (CRI) is driven by the system's parallel data clock when at the source end of the link, or by the link clock when at the destination end of the link. The differential clock reference input may be driven by either an LVDS differential signal, or by a single ended clock of either polarity. For single-ended use the nonclocked input is biased to the logic threshold voltage. A $V_{CC}/2$ threshold reference, VT, is provided on a pin adjacent the differential CRI pins for convenience when the input is used in a single-ended mode.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

DESCRIPTION (CONTINUED)

The multiplied clock output (MCO) is an LVDS differential signal used to drive the high-speed shift registers in either the SN65LVDS151 serializer-transmitter or the SN65LVDS152 receiver-deserializer. The link clock reference output (LCRO) is an LVDS differential signal provided to the SN65LVDS151 serializer-transmitter for transmission over the link.

An internal power on reset and an enable input (EN) control the operation of the SN65LVDS150. When V_{CC} is below 1.5 V, or when EN is low, the device is in a low power disabled state and the MCO and LCRO differential outputs are in a high-impedance state. When V_{CC} is above 3 V and EN is high, the device and the two differential outputs are enabled and operating to specifications. The link clock reference output enable input (LCRO_EN) is used to turn off the LCRO output when it is not being used. A band select input (BSEL) is used to optimize the VCO performance as a function of M-clock frequencies and M multiplier that is being used: The f_{max} parameter in the switching characteristic table includes details on the MCO frequency and choices of BSEL and M.

Terminal Functions

| TERMINAL NAME | NO. | I/O | TYPE | DESCRIPTION |
|------------------|----------------------|-----|--------|---|
| BSEL | 11 | I | LVTTTL | Band select. Used to optimize VCO performance for minimum M-clock jitter: See recommended f_{max} in the frequency multiplier value table. |
| CRI+, CRI– | 2, 3 | I | LVDS | Clock reference input. This is the reference clock signal for the PLL frequency multiplier. |
| EN | 17 | I | LVTTTL | Enable input. Used to disable the device to a low power state. A high level input enables the device, a low level input disables the device. |
| GND | 5, 12, 18, 22, 24 | I | NA | Circuit ground |
| LCRO–, LCRO+ | 13, 14 | O | LVDS | Link clock reference output. This is the data block synchronization clock signal from the PLL frequency multiplier. |
| LCRO_EN | 16 | I | LVTTTL | LCRO enable. Used to turn off the LCRO outputs when they are not used. A high level input enables the LCRO output; a low level input disables the LCRO output. |
| LVO | 15 | O | LVTTTL | Lock/valid output. This is signal required for proper Muxlt system operation. It is to be directly connected to the LVI inputs of SN65LVDS151 or SN65LVDS152 devices. It is used to inhibit the operation of those devices until after the PLL has stabilized. It remains at a low level following a reset until the PLL has become phase locked. A low to high-level transition indicates phase lock has occurred. |
| M1–M5 | 6–10 | I | LVTTTL | Multiplier value selection inputs. These inputs determine the frequency multiplication ratio M. |
| MCO–, MCO+ | 19, 20 | O | LVDS | M-clock output. This is the high frequency multiplied clock output from the PLL frequency multiplier. It is used by the companion serializer or deserializer devices to synchronizes the transmission or reception of data |
| NC | 21, 23, 26–28 | | NA | These pins are not connected and may be left open. |
| V _{CC} | 1, 25 | | NA | Supply voltage |
| V _T | 4 | | NA | Voltage reference. A V _{CC} /2 reference supplied for the unused CRI input when operated in a single-ended mode. |

TYPICAL CHARACTERISTICS (continued)

BASIC APPLICATIONS EXAMPLES

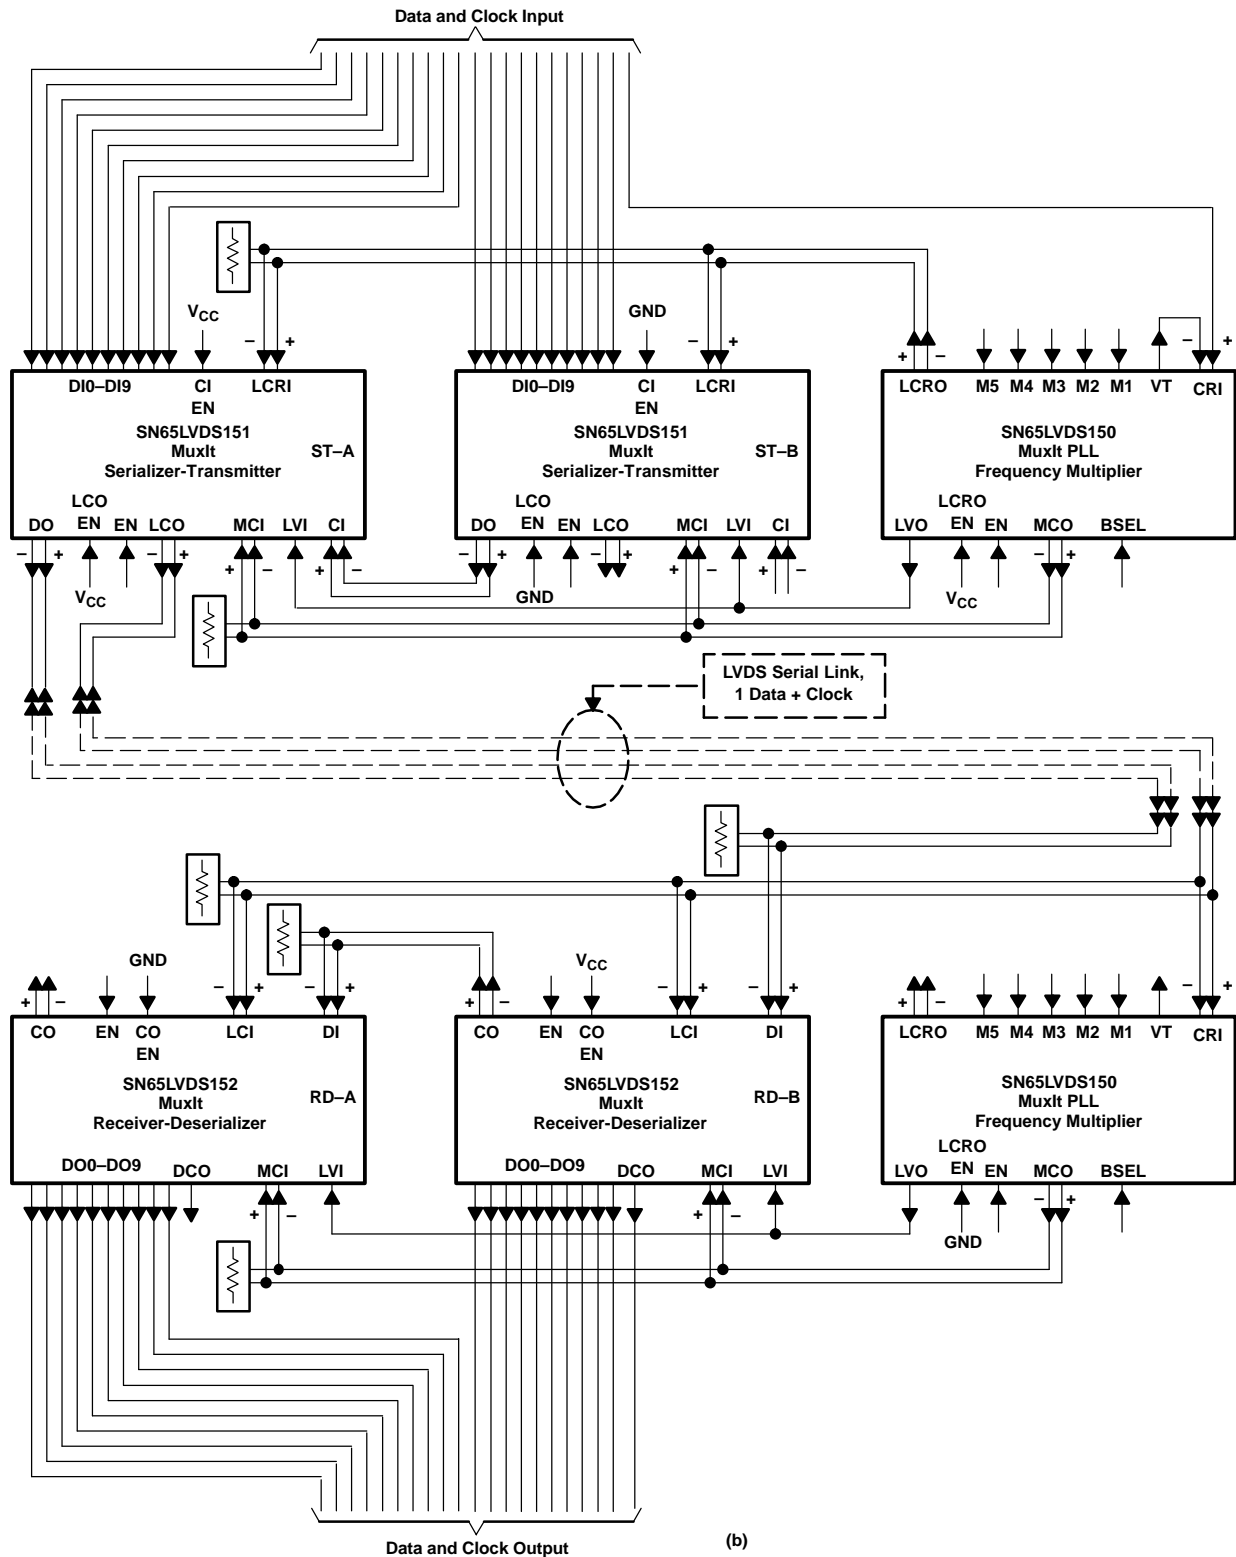

Parallel data path width between 4 and 10 bits, only one LVDS data link required.

(a)

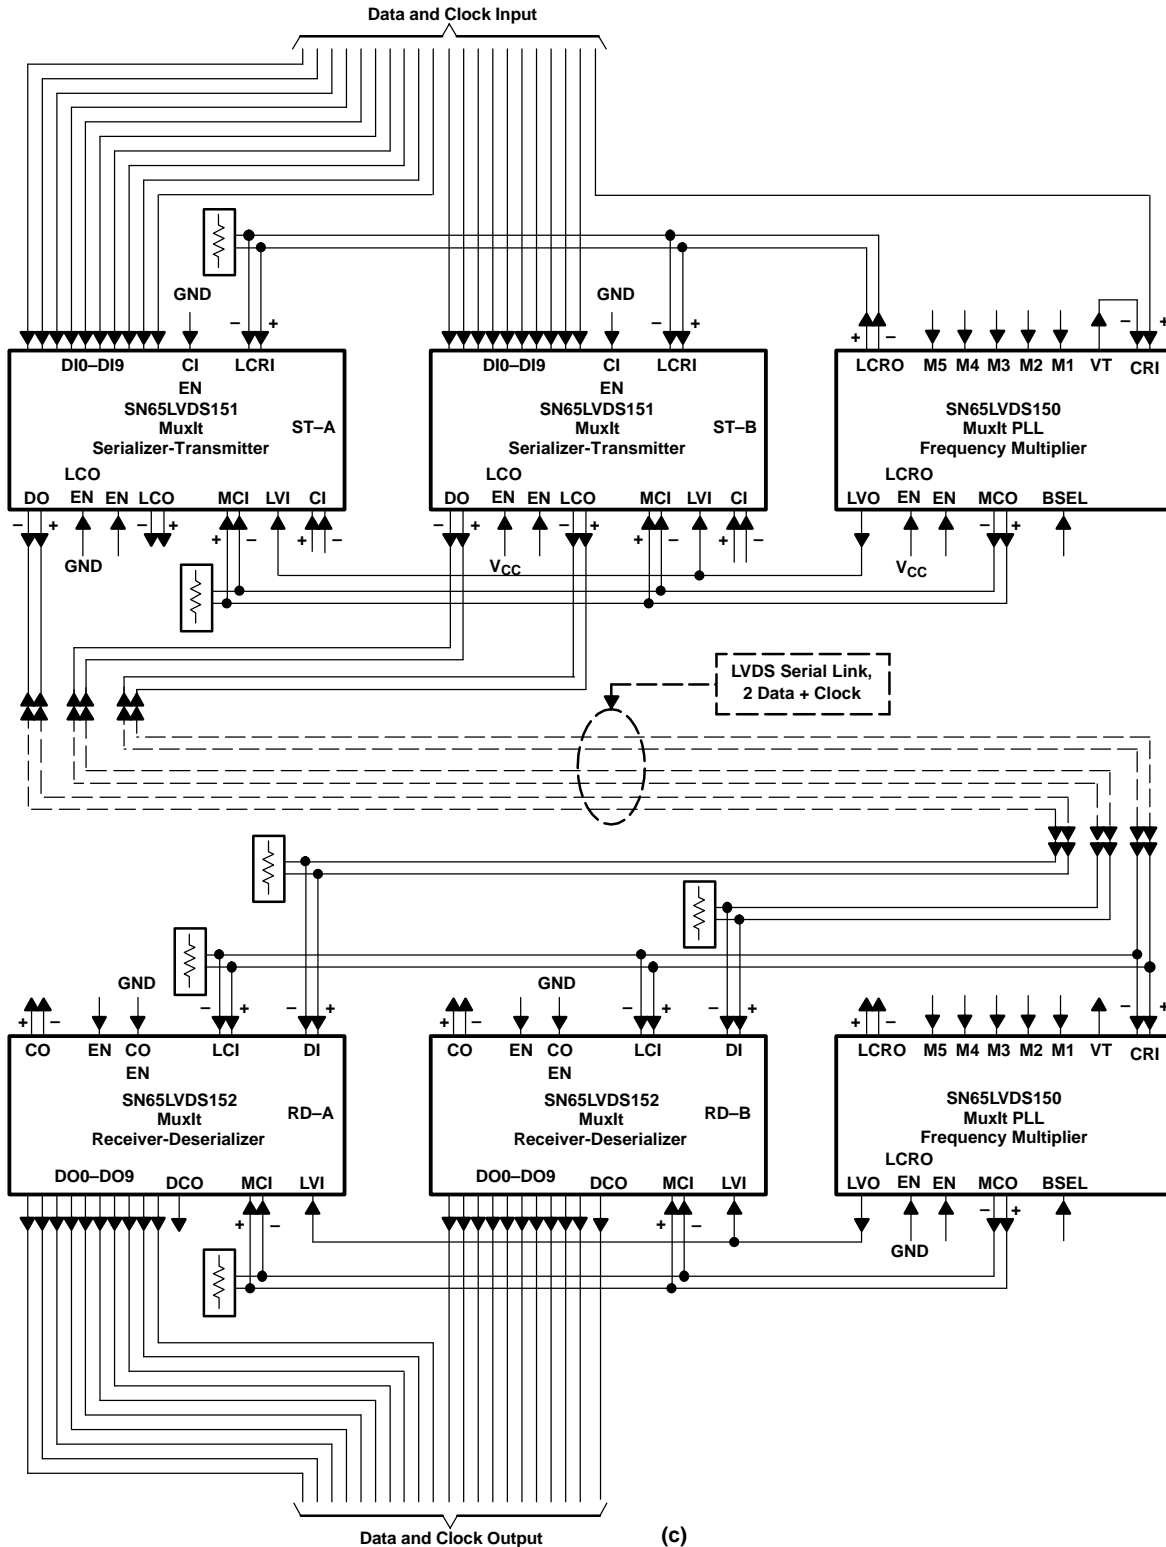

TYPICAL CHARACTERISTICS (continued)

Parallel data path width between 11 and 20 bits, aggregate data rate low enough to allow transmission over one LVDS data link, sharing of PLL-FM between serializer-transmitter and receiver-deserializer chips at each end.

TYPICAL CHARACTERISTICS (continued)

Parallel data path width between 11 and 20 bits, aggregate data rate requires transmission over two separate LVDS data links, sharing of PLL-FM between serializer-transceiver and receiver-deserializer chips at each end.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
