Description and Applications

The ZXGD3005E6 is a high-speed non-inverting single gate driver capable of driving up to 10A into a MOSFET or IGBT gate capacitive load from supply voltages up to 25V. With propagation delay times down to <10ns and correspondingly rise/fall times of <20ns.

This gate driver ensures rapid switching of the MOSFET or IGBT to minimize power losses and distortion in high current switching applications. It is ideally suited to act as a voltage buffer between the typically high output impedances of a controller IC and the effectively low impedance on the gate of a power MOSFET or IGBT during switching. Its low input voltage requirement and high current gain allows high current driving from low voltage controller ICs.

The ZXGD3005E6 has separate source and sink outputs that enables the turn-on and turn-off times of the MOSFET or IGBT to be independently controlled. In addition, the wide supply voltage range allows full enhancement of the MOSFET or IGBT to minimize on-state losses and permits +15V to -5V gate drive voltage to prevent dV/dt induced false triggering of IGBTs. The ZXGD3005E6 has been designed to be inherently rugged to latch-up and shoot-through issues. The optimized pin-out SOT26 package eases board layout, enabling reduced parasitic inductance of traces.

Power MOSFET and IGBT Gate Driving in:

- Synchronous Switch-Mode Power Supplies
- Power Factor Correction (PFC) in Power Supplies
- Secondary Side Synchronous Rectification
- Plasma Display Panel Power Modules
- 1, 2 and 3-Phase Motor Control Circuits
- Audio Switching Amplifier Power Output Stages
- Solar Inverters

Features and Benefits

- Emitter-Follower Configuration for Ultra-Fast Switching
- <10ns Propagation Delay Time
- <20ns Rise/Fall Time
- Non-Inverting Voltage Buffer Stage
- Wide Supply Voltage Up to 25V to Minimize On-Losses
- 10A Peak Current Drive into Capacitive Loads
- Low Input Current of 1mA to Deliver 4A Output Current
- Separate Source and Sink Outputs for Independent Control of Rise and Fall Time
- Optimized Pin-Out to Ease Board Layout and Minimize Parasitic Inductance of Traces
- Rugged Design That Avoids Latch-Up or Shoot-Through Issues
- Near - Zero Quiescent Supply Current
- **Totally Lead-Free & Fully RoHS Compliant (Notes 1 & 2)**
- **Halogen and Antimony Free. "Green" Device (Note 3)**
- **For automotive applications requiring specific change control (i.e. parts qualified to AEC-Q100/101/200, PPAP capable, and manufactured in IATF 16949 certified facilities), please contact us or your local Diodes representative.**

Mechanical Data

- Case: SOT26
- Case Material: Molded Plastic, "Green" Molding Compound UL Flammability Classification Rating 94V-0
- Moisture Sensitivity: Level 1 per J-STD-020
- Terminals: Finish – Matte Tin Plated Leads, Solderable per MIL-STD-202, Method 208 (e3)
- Weight: 0.018 grams (Approximate)

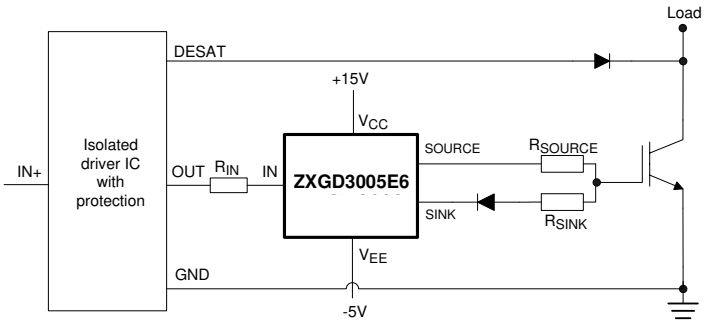
Application Notes

Independent Control of Rise and Fall Time

An application may require the turn-on (t_{ON}) and turn-off (t_{OFF}) time to be independently controlled, which can be achieved by setting different R_{SOURCE} and R_{SINK} values. With asymmetric R_{SOURCE} and R_{SINK} resistors, then a potential difference will occur between the SOURCE and SINK pins during the switching transition. If the potential difference across the SOURCE and SINK pins is greater than 7.5V, then it could damage the ZXGD3005E6.

In this circuit example of driving an IGBT, a blocking diode is added in series with R_{SINK} to protect against excess reverse current being induced into the SINK pin.



Circuit Example of Driving A MOSFET

Application example of gate driving a MOSFET from 0V to 15V with $R_{SOURCE} = R_{SINK} = 0\Omega$
