

## FEATURES

- Low On-resistance:  $r_{DS(on)} = 5\Omega$
- Fast transition time:  $t_{TRAN} = 6ns$
- Wide bandwidth: 1.3GHz (-3dB point)
- Crosstalk:
  - 90dB @ 50KHz, -40dB @ 5MHz,
  - 30dB @ 30MHz
- Off-isolation:
  - 70dB @ 50KHz, -40dB @ 5MHz,
  - 30dB @ 30MHz,
- Single 5V supply
- Can be used as a multiplexer or demultiplexer
- TTL compatible control inputs
- Ultra-low quiescent current: 3 $\mu$ A
- Switch turn on time of 6.5ns

## APPLICATIONS

- High-speed video signal switching/routing
- HDTV-quality video signal routing
- Phase reversal
- Data acquisition
- ATE systems
- Telecomm routing
- Token Ring transceivers
- High-speed networking

## GENERAL DESCRIPTION

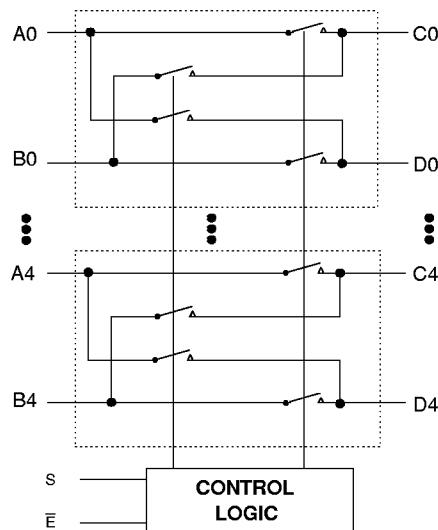

The QS4A201Q is a high-performance CMOS. This device provides 2 sets of five high-speed CMOS switches providing "cross point" connection between inputs and outputs. The low on-resistance of the QS4A201Q allows inputs to be connected to outputs with low insertion loss and high bandwidth. TTL-compatible control circuitry with "Break-Before-Make" feature prevents contention.

The QS4A201Q with 1.3 GHz bandwidth makes it ideal for high-performance video signal switching, audio signal switching, and telecomm routing applications. High performance and low power dissipation makes this device ideal for battery operated and remote instrumentation applications.

The QS4A201Q is offered in the QSOP package and has several advantages over conventional packages such as PDIP and SOIC including:

- Reduced signal delays due to denser component packaging on circuit boards
- Reduced system noise due to less pin inductance

**Notes:**

- Typical values indicate  $V_{CC} = 5.0\text{V}$  and  $T_A = 25^\circ\text{C}$ .
- Guaranteed by design, not subject to production test.
- Measured by voltage drop between A and C pins or B and D pins at indicated current through the switch. On-resistance is determined by the lower of the voltages on the two (A,B or C,D) pins.
- $\Delta r_{DS(on)}$  compares On-resistance at the specified  $V_{IN}$  Values.
- The bus switch contributes no group delay other than the RC delay of the on-resistance of the switch and load capacitance. Group delay of the bus switch, when used in a system, is determined by the driving circuit on the driving side of the switch and its interaction with the load on the driven side.
