4.5-V TO 16-V INPUT, HIGH CURRENT, SYNCHRONOUS STEP DOWN THREE DC-DC CONVERTERS WITH INTEGRATED FET

Check for Samples: TPS652510

FEATURES

- **Wide Input Supply Voltage Range: 4.5 V - 16 V**
- **0.8-V, 1% Accuracy Reference**
- **Continuous Loading: 3 A (Buck1), 2 A (Buck2 and 3)**
- **Maximum Current: 3.5 A (Buck 1), 2.5 A (Buck2 and 3)**
- **Synchronous Operation, 300-kHz – 2.2-MHz Switching Frequency Set By External Resistor**
- **External Enable Pins With Built-In Current Source for Easy Sequencing**
- **External Soft Start Pins**
- **Adjustable Cycle-by-Cycle Current Limit Set by External Resistor**
- **Current-Mode Control With Simple Compensation Circuit**
- **Automatic Low Pulse Skipping (PSM) Power Mode, Allowing for an Output Ripple Better than 2%**
- **Support Pre-Biased Outputs**
- **Power Good Supervisor and Reset Generator**
- **Small, Thermally Efficient 40-Pin 6-mm x 6-mm RHA (QFN) package**
- **-40°C to 125°C Junction Temperature Range**

DESCRIPTION/ORDERING INFORMATION

TPS652510 is a power management IC with three step-down buck converters. Both high-side and low-side MOSFETs are integrated to provide fully synchronous conversion with higher efficiency. The converters are designed to simplify its application while giving the designer the option to optimize their usage according to the target application.

The converters can operate in 5-, 9-, 12- or 15-V systems. The output voltage can be set externally using a resistor divider to any value between 0.8 V and the input supply minus the resistive drops on the converter path. Each converter features enable pin that allows a delayed start-up for sequencing purposes, soft start pin that allows adjustable soft-start time by choosing the soft-start capacitor, and a current limit (RLIM) pin that enables designer to adjust current limit by selecting an external resistor and optimize the choice of inductor. All converters operate in 'hiccup mode': Once an over-current lasting more than 10 ms is sensed in any of the converters, they will shut down for 10 ms and then the start-up sequencing will be tried again. If the overload has been removed, the converter will ramp up and operate normally. If this is not the case the converter will see another over-current event and shuts down again repeating the cycle (hiccup) until the failure is cleared. If an overload condition lasts for less than 10 ms, only the relevant converter affected will shut-down and re-start and no global hiccup mode will occur.

The switching frequency of the converters is set by an external resistor connected to ROSC pin. The switching regulators are designed to operate from 300 kHz to 2.2 MHz. The converters operate with 180° phase between then to minimize the input filter requirements. All converters have peak current mode control which simplifies external frequency compensation.

The device has a built-in slope compensation ramp to prevent sub harmonic oscillations in peak current mode control. A traditional type II compensation network can stabilize the system and achieve fast transient response. Moreover, an optional capacitor in parallel with the upper resistor of the feedback divider provides one more zero and makes the crossover frequency over 100 kHz.

All converters feature an automatic low power pulse PFM skipping mode which improves efficiency during light loads and standby operation, while guaranteeing a very low output ripple, allowing for a value of less than 2% at low output voltages.

The device incorporates an overvoltage transient protection circuit to minimize voltage overshoot. The OVP feature minimizes the output overshoot by implementing a circuit to compare the FB pin voltage to OVP threshold which is 109% of the internal voltage reference. If the FB pin voltage is greater than the OVTP threshold, the high side MOSFET is disabled preventing current from flowing to the output and minimizing output overshoot. When the FB voltage drops lower than the OVP lower threshold which is 107%, the high side MOSFET is allowed to turn on the next clock cycle.

TPS652510 features a supervisor circuit which monitors each buck's output and the PGOOD pin is asserted once sequencing is done. The PGOOD pin is an open drain output. The PGOOD pin is pulled low when any buck converter is pulled below 85% of the nominal output voltage. The PGOOD is pulled up when all converter outputs are more than 90% of its nominal output voltage. The default reset time is 100 ms. The polarity of the PGOOD is active high.

The device implements an internal thermal shutdown to protect itself if the junction temperature exceeds 160°C. The thermal shutdown forces the device to stop operating when the junction temperature exceeds thermal trip threshold. Once the die temperature decreases below 140°C, the device reinitiates the power up sequence. The thermal shutdown hysteresis is 20°C.

ORDERING INFORMATION(1)

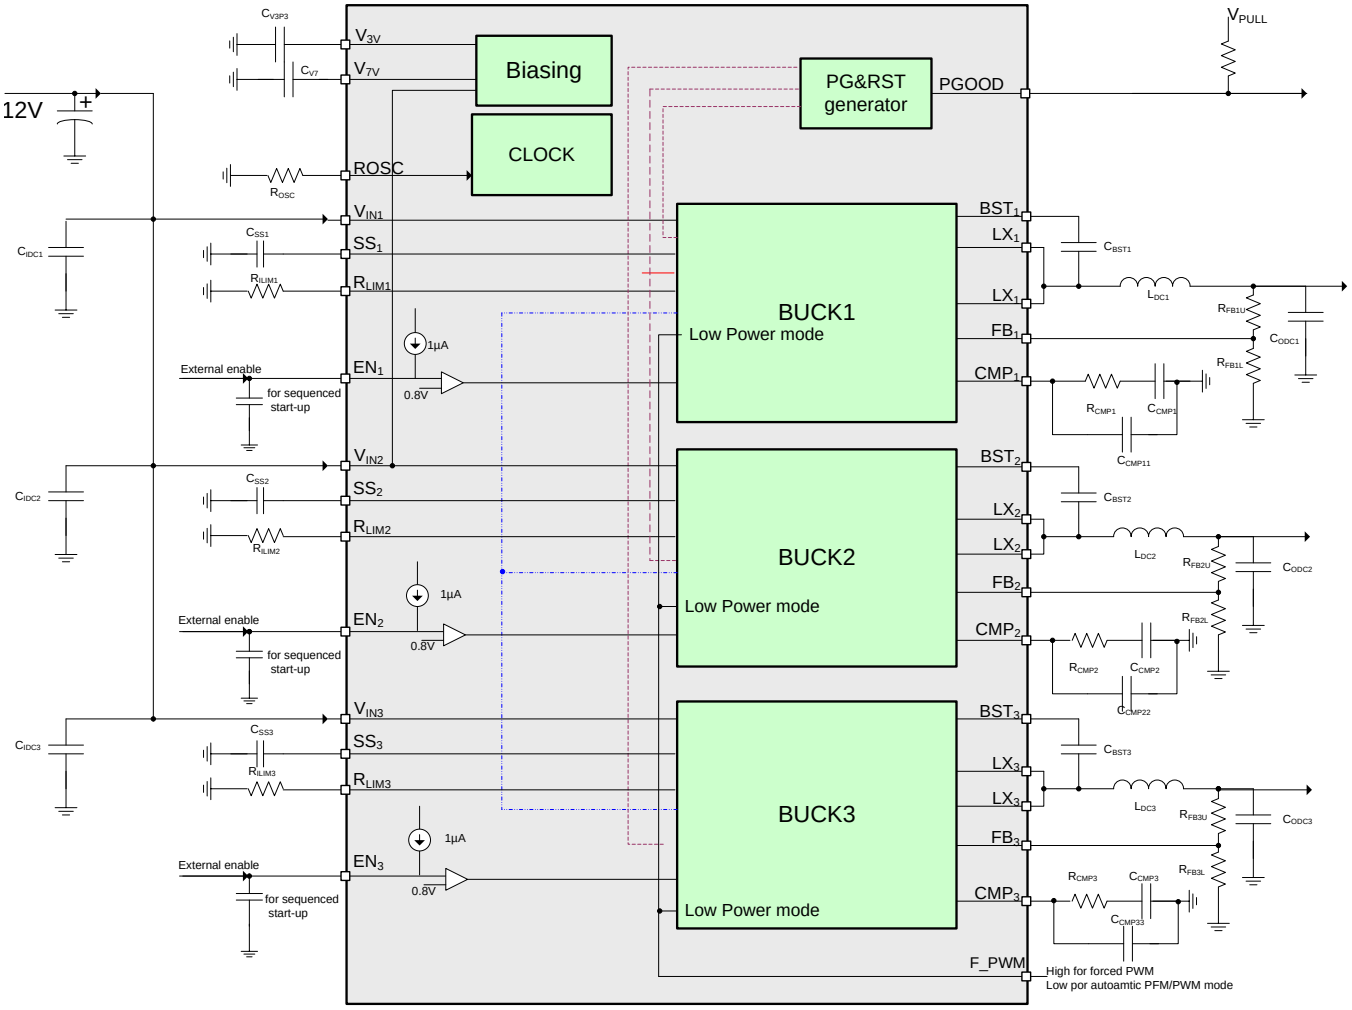
-40°C to 125°C	40-Pin (QFN) - RHA	Reel of 2500	TPS652510RHAR	TPS652510

(1) For the most current packaging and ordering information, see the Package Option Addendum at the end of this document, or see the TI web site at www.ti.com.
(2) Package drawings, thermal data, and symbolization are available at www.ti.com/packaging.

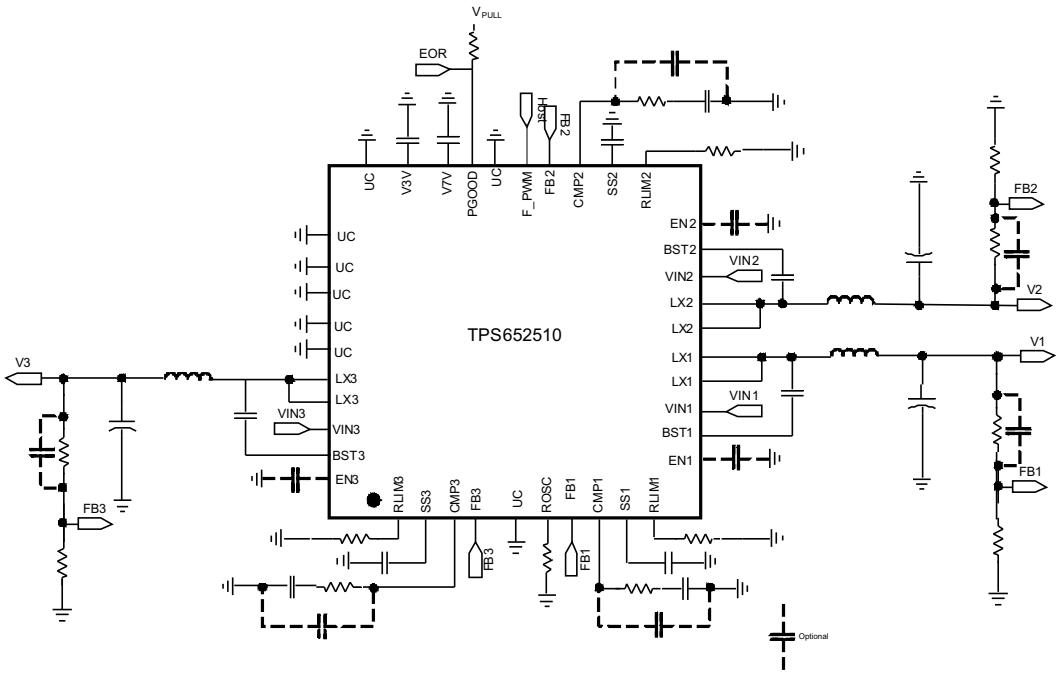
This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

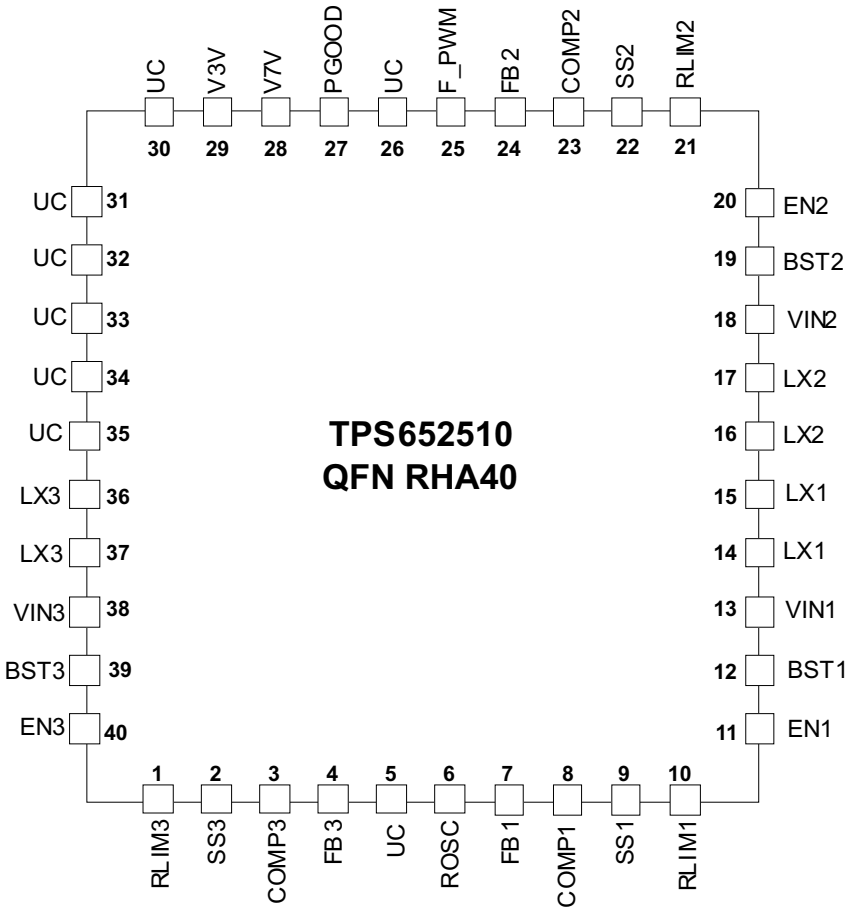
FUNCTIONAL BLOCK DIAGRAM



TYPICAL APPLICATION



PIN OUT



TERMINAL FUNCTIONS

NAME	NO.	I/O	DESCRIPTION
RLIM3	1	I	Current limit setting for Buck3. Fit a resistor from this pin to ground to set the peak current limit on the output inductor.
SS3	2	I	Soft start pin for Buck3. Fit a small ceramic capacitor to this pin to set the converter soft start time.
COMP3	3	O	Compensation for Buck3. Fit a series RC circuit to this pin to complete the compensation circuit of this converter.
FB3	4	I	Feedback pin for Buck3. Connect a divider set to 0.8 V from the output of the converter to ground.
UC	5		Unused pin, connect to ground
ROSC	6	I	Oscillator set. This resistor sets the frequency of internal autonomous clock.
FB1	7	I	Feedback pin for Buck1. Connect a divider set to 0.8 V from the output of the converter to ground.
COMP1	8	O	Compensation pin for Buck1. Fit a series RC circuit to this pin to complete the compensation circuit of this converter.
SS1	9	I	Soft-start pin for Buck1. Fit a small ceramic capacitor to this pin to set the converter soft-start time.
RLIM1	10	I	Current limit setting pin for Buck1. Fit a resistor from this pin to ground to set the peak current limit on the output inductor.
EN1	11	I	Enable pin for Buck1. A high signal on this pin enables the regulator Buck. For a delayed start-up add a small ceramic capacitor from this pin to ground.
BST1	12		Bootstrap capacitor for Buck1. Fit a 47-nF ceramic capacitor from this pin to the switching node.
VIN1	13	I	Input supply for Buck1. Fit a 10-µF ceramic capacitor close to this pin.
LX1	14, 15	O	Switching node for Buck1
LX2	16, 17	O	Switching node for Buck2
VIN2	18	I	Input supply for Buck2. Fit a 10-µF ceramic capacitor close to this pin.
BST2	19		Bootstrap capacitor for Buck2. Fit a 47-nF ceramic capacitor from this pin to the switching node.
EN2	20	I	Enable pin for Buck2. A high signal on this pin enables the regulator. For a delayed start-up add a small ceramic capacitor from this pin to ground.
RLIM2	21	I	Current limit setting pin for Buck2. Fit a resistor from this pin to ground to set the peak current limit on the output inductor.
SS2	22	I	Soft-start pin for Buck2. Fit a small ceramic capacitor to this pin to set the converter soft-start time.
COMP2	23	O	Compensation pin for Buck2. Fit a series RC circuit to this pin to complete the compensation circuit of this converter.
FB2	24	I	Feedback input for Buck2. Connect a divider set to 0.8 V from the output of the converter to ground.
F_PWM	25		Forces PWM operation in all converters when set high. If low converters will operate in automatic PFM/PWM mode.
UC	26		Unused pin, connect to ground
PGOOD	27	O	Power good. Open drain output asserted low after all converters and sequenced and within regulation. Polarity is factory selectable (active high default).
V7V	28	O	Internal supply. Connect a 4.7-µF to 10-µF ceramic capacitor from this pin to ground.
V3V	29	O	Internal supply. Connect a 3.3-µF to 10-µF ceramic capacitor from this pin to ground.
UC	30		Unused pin, connect to ground
UC	31		Unused pin, connect to ground
UC	32		Unused pin, connect to ground
UC	33		Unused pin, connect to ground
UC	34		Unused pin, connect to ground

TERMINAL FUNCTIONS (continued)

NAME	NO.	I/O	DESCRIPTION
UC	35		Unused pin, connect to ground
LX3	36, 37	O	Switching node for Buck3
VIN3	38	I	Input supply for Buck3. Fit a 10-µF ceramic capacitor close to this pin.
BST3	39	I	Bootstrap capacitor for Buck3. Fit a 47-nF ceramic capacitor from this pin to the switching node.
EN3	40	I	Enable pin for Buck3. A high signal on this pin enables the converter. For a delayed start-up add a small ceramic capacitor from this pin to ground.
PowerPAD			PowerPAD. Connect to system ground for electrical and thermal connection.

ABSOLUTE MAXIMUM RATINGS (1)

over operating free-air temperature range (unless otherwise noted, all voltages are with respect to GND)

	Voltage range at VIN1,VIN2, VIN3, LX1, LX2, LX3	–0.3 to 18	V
	Voltage range at LX1, LX2, LX3 (maximum withstand voltage transient < 10 ns)	–3 to 18	V
	Voltage at BST1, BST2, BST3 referenced to LX pin	–0.3 to 7	V
	Voltage at V7V, COMP1, COMP2, COMP3	–0.3 to 7	V
	Voltage at V3V, RLIM1, RLIM2, RLIM3, EN1, EN2, EN3, SS1, SS2, SS3, FB1, FB2, FB3, F_PWM, PGOOD, ROSC	–0.3 to 3.6	V
T_J	Operating junction temperature range	–40 to 125	°C
T_{STG}	Storage temperature range	–55 to 150	°C

(1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute–maximum–rated conditions for extended periods may affect device reliability.

RECOMMENDED OPERATING CONDITIONS

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT

DETAILED DESCRIPTION

Adjustable Switching Frequency

To select the internal switching frequency, connect a resistor from ROSC to ground. Figure 32 shows the required resistance for a given switching frequency.

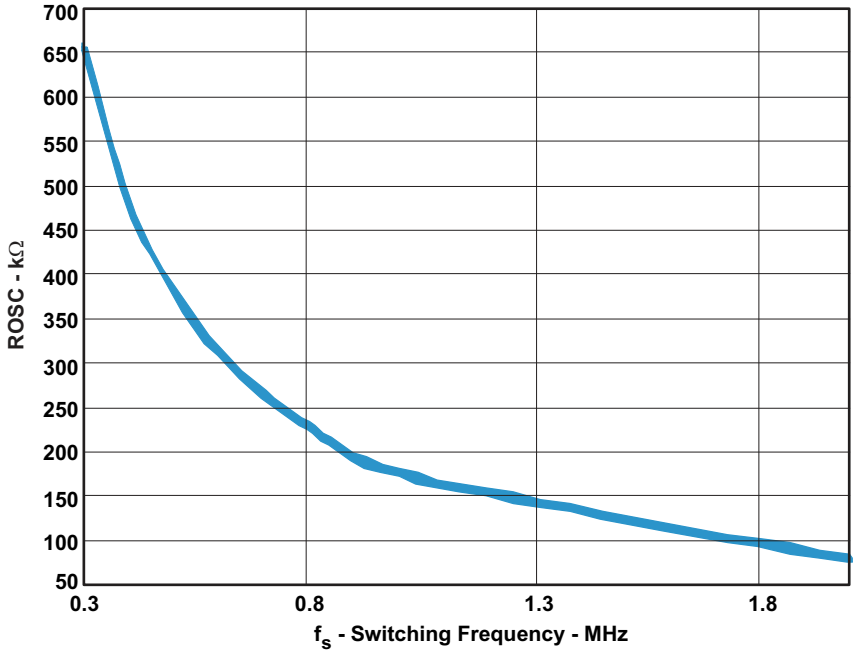

Figure 32. ROSC vs Switching Frequency

$$R_{OSC}(k\Omega) = 174 \bullet f_{SW}^{-1.122} \quad (1)$$

Output Inductor Selection

To calculate the value of the output inductor, use Equation 2.

$$Lo = \frac{Vin - Vout}{Io \cdot K_{ind}} \cdot \frac{Vout}{Vin \cdot fsw} \quad (2)$$

K_{ind} is a coefficient that represents the amount of inductor ripple current relative to the maximum output current. In general, K_{ind} is normally from 0.1 to 0.3 for the majority of applications. A value of 0.1 will improve the efficiency at light load, while a value of 0.3 will provide the lowest possible cost solution. The ripple current is:

$$Iripple = \frac{Vin - Vout}{Lo} \cdot \frac{Vout}{Vin \cdot fsw} \quad (3)$$

Output Capacitor

There are two primary considerations for selecting the value of the output capacitor. The output capacitors are selected to meet load transient and output ripple's requirements. If a minimum transient specification is required use the following equation:

$$Co > \frac{\Delta I_{OUT}{}^2 \cdot L_o}{V_{out} \cdot \Delta Vout} \quad (4)$$

The following equation calculates the minimum output capacitance needed to meet the output voltage ripple specification.

$$Co > \frac{1}{8 \cdot fsw} \cdot \frac{1}{\frac{V_{RIPPLE}}{I_{RIPPLE}}} \quad (5)$$

Where f_{SW} is the switching frequency, V_{RIPPLE} is the maximum allowable output voltage ripple, and I_{RIPPLE} is the inductor ripple current.

Input Capacitor

A minimum 10-µF X7R/X5R ceramic input capacitor is recommended to be added between VIN and GND of each converter. The input capacitor must handle the RMS ripple current shown in the following equation.

$$Icirms = Iout \cdot \sqrt{\frac{Vout}{Vin\,\min} \cdot \frac{(Vin\,\min - Vout)}{Vin\,\min}} \quad (6)$$

Bootstrap Capacitor

The device has two integrated boot regulators and requires a small ceramic capacitor between the BST and LX pins to provide the gate drive voltage for the high side MOSFET. The value of the ceramic capacitor should be 0.047 µF. A ceramic capacitor with an X7R or X5R grade dielectric is recommended because of the stable characteristics over temperature and voltage.

Soft-Start Time

The device has an internal pull-up current source of 5 µA that charges an external soft-start capacitor to implement a slow start time. Equation 7 shows how to select a soft-start capacitor based on an expected slow start time. The voltage reference (V_{REF}) is 0.8 V and the soft-start charge current (I_{ss}) is 5 µA. The soft-start circuit requires 1 nF per around 167 µs to be connected at the SS pin. A 0.8-ms soft-start time is implemented for all converters fitting 4.7 nF to the relevant SS pin.

$$T_{ss}(ms) = V_{REF}(V) \bullet \left(\frac{C_{ss}(nF)}{I_{ss}(\mu A)} \right) \quad (7)$$

The Power Good circuit for the bucks has a 10-ms watchdog. Therefore the soft-start time should be lower than this value. It is recommended not to exceed 5 ms.

Delayed Start-Up

If a delayed start-up is required on any of the buck converters fit a ceramic capacitor to the ENx pins. The delay added is ~1.67 ms per nF connected to the pin. Note that the EN pins have a weak 1-MΩ pull-up to the 3V3 rail.

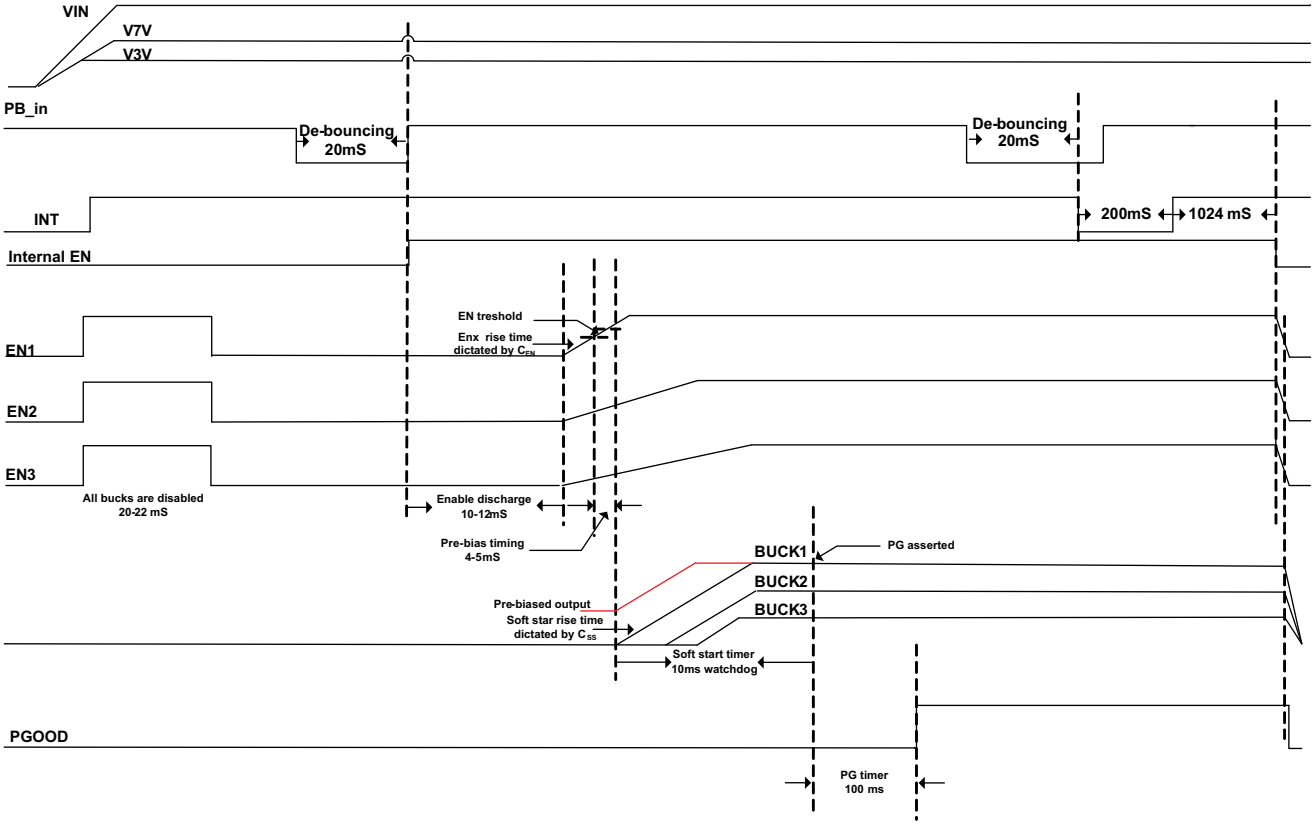

Figure 33. Delayed Start-Up

Out-of-Phase Operation

In order to reduce input ripple current, Buck1 and Buck2 operate 180° out-of-phase. This enables the system having less input ripple, then to lower component cost, save board space and reduce EMI.

Adjusting the Output Voltage

The output voltage is set with a resistor divider from the output node to the FB pin. It is recommended to use 1% tolerance or better divider resistors. In order to improve efficiency at light load, start with a value close to 40 kΩ for the R1 resistor and use Equation 8 to calculate R2.

$$R2 = R1 \cdot \left(\frac{0.8V}{V_O - 0.8V} \right) \tag{8}$$

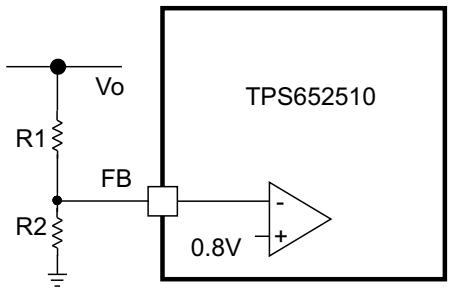

Figure 34. Voltage Divider Circuit

Loop Compensation

TPS652510 is a current mode control DC/DC converter. The error amplifier is a transconductance amplifier with a g_M of 130 µA/V. A typical compensation circuit could be type II (R_c and C_c) to have a phase margin between 60° and 90°, or type III (R_c and C_c and C_{ff} to improve the converter transient response. C_{Roll} adds a high frequency pole to attenuate high-frequency noise when needed. It may also prevent noise coupling from other rails if there is possibility of cross coupling in between rails when layout is very compact.

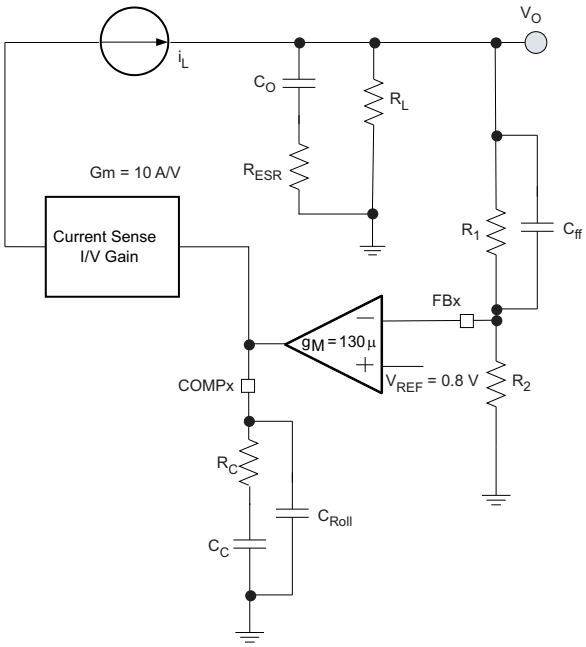

Figure 35. Loop Compensation Scheme

To calculate the external compensation components follow the following steps:

	TYPE II CIRCUIT	TYPE III CIRCUIT
Select switching frequency that is appropriate for application depending on L, C sizes, output ripple, EMI concerns and etc. Switching frequencies around 500 kHz yield best trade off between performance and cost. When using smaller L and C, switching frequency can be increased. To optimize efficiency, switching frequency can be lowered.		Type III circuit recommended for switching frequencies higher than 500 kHz.
Select cross over frequency (f_c) to be at least 1/5 to 1/10 of switching frequency (f_s).	Suggested $f_c = f_s/10$	Suggested $f_c = f_s/10$
Set and calculate R_c.	$R_C = \frac{2\pi \cdot fc \cdot Vo \cdot Co}{g_M \cdot Vref \cdot gm_{ps}}$	$R_C = \frac{2\pi \cdot fc \cdot Co}{g_M \cdot gm_{ps}}$
Calculate C_c by placing a compensation zero at or before the converter dominant pole $fp = \frac{1}{C_O \cdot R_L \cdot 2\pi}$	$C_c = \frac{R_L \cdot Co}{R_c}$	$C_c = \frac{R_L \cdot Co}{R_c}$
Add C_{Roll} if needed to remove large signal coupling to high impedance CMP node. Make sure that $fp_{Roll} = \frac{1}{2 \cdot \pi \cdot R_C \cdot C_{Roll}}$ is at least twice the cross over frequency.	$C_{Roll} = \frac{\mathrm{Re}\,sr \cdot Co}{R_C}$	$C_{Roll} = \frac{\mathrm{Re}\,sr \cdot Co}{R_C}$
Calculate C_{ff} compensation zero at low frequency to boost the phase margin at the crossover frequency. Make sure that the zero frequency (fz_{ff}) is smaller than equivalent soft-start frequency ($1/T_{ss}$).	NA	$C_{ff} = \frac{1}{2 \cdot \pi \cdot fz_{ff} \cdot R_1}$

Slope Compensation

The device has a built-in slope compensation ramp. The slope compensation can prevent sub harmonic oscillations in peak current mode control.

Power Good

The PGOOD pin is an open drain output. The PGOOD pin is pulled low when any buck converter is pulled below 85% of the nominal output voltage. The PGOOD is pulled up when both buck converters' outputs are more than 90% of its nominal output voltage.

The default reset time is 100 ms. The polarity of the PGOOD is active high.

Current Limit Protection

Figure 36 shows the (peak) inductor current limit for Buck 1. The typical limit can be approximated with the following graph.

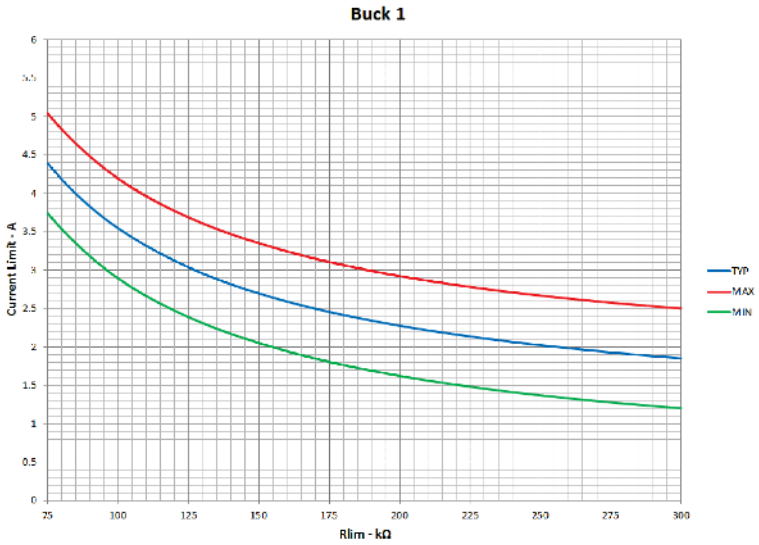

Figure 36. Buck 1

Figure 37 shows the (peak) inductor current limit for Buck 2. The typical limit can be approximated with the following graph.

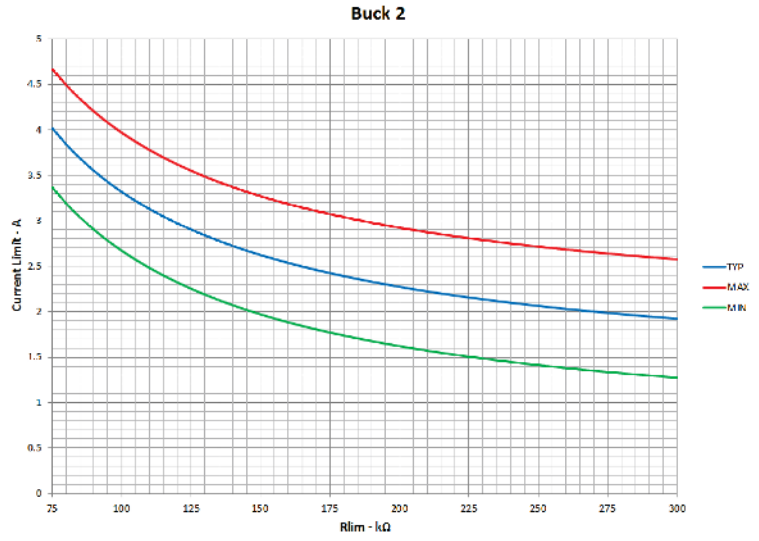

Figure 37. Buck 2

Figure 38 shows the (peak) inductor current limit for Buck 3. The typical limit can be approximated with the following graph.

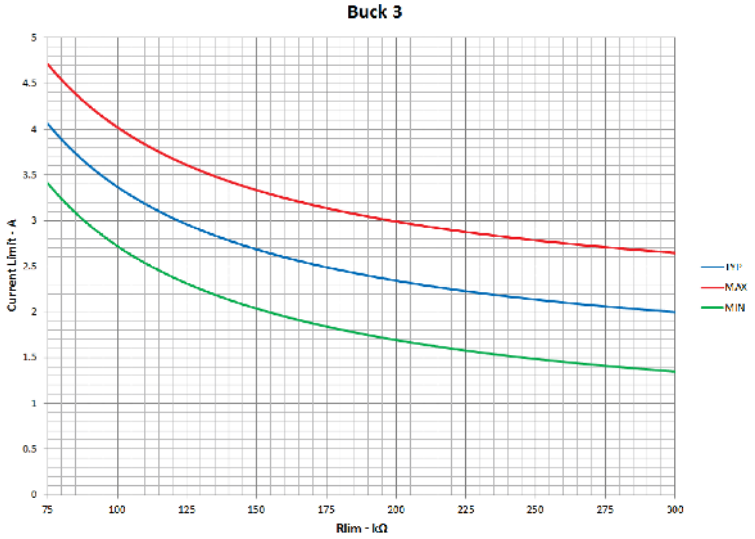

Figure 38. Buck 3

The current limit should be set by using either the TYP or MIN line. If using the TYP line, ensure that limit trips at the MIN line are acceptable for your application. When setting high-side current limit to large current values, ensure that the additional load immediately prior to an overcurrent condition will not cause the switching node voltage to exceed 20 V. Additionally, ensure during worst case operation, with all bucks loaded immediately prior to current limit, the maximum virtual junction temperature of the device does not exceed 125°C.

All converters operate in hiccup mode: Once an over-current lasting more than 10 ms is sensed in any of the converters, they will shut down for 10 ms and then the start-up sequencing will be tried again. If the overload has been removed, the converter will ramp up and operate normally. If this is not the case the converter will see another over-current event and shuts-down again repeating the cycle (hiccup) until the failure is cleared.

If an overload condition lasts for less than 10 ms, only the relevant converter affected will shut-down and re-start and no global hiccup mode will occur.

Overvoltage Transient Protection

The device incorporates an overvoltage transient protection (OVP) circuit to minimize voltage overshoot. The OVP feature minimizes the output overshoot by implementing a circuit to compare the FB pin voltage to OVTP threshold which is 109% of the internal voltage reference. If the FB pin voltage is greater than the OVTP threshold, the high side MOSFET is disabled preventing current from flowing to the output and minimizing output overshoot. When the FB voltage drops lower than the OVTP threshold which is 107%, the high side MOSFET is allowed to turn on the next clock cycle.

Low Power/Pulse Skipping Operation

When a buck synchronous converter operates at light load or standby conditions, the switching losses are the dominant source of power losses. Under these load conditions, TPS652510 uses a pulse skipping modulation technique to reduce the switching losses by keeping the power transistors in the off-state for several switching cycles, while maintaining a regulated output voltage. Figure 39 shows the output voltage and load plus the inductor current.

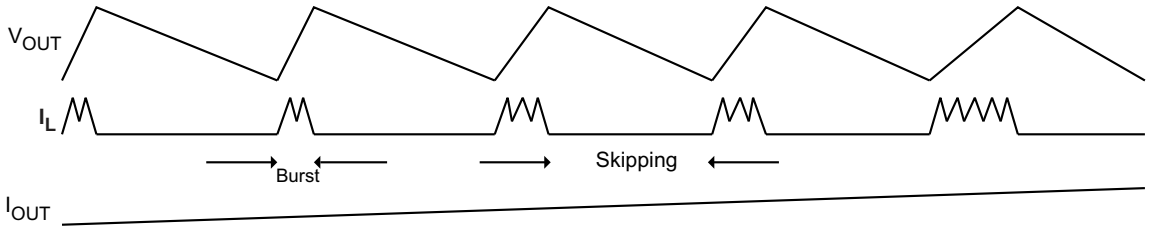

Figure 39. Low Power/Pulse Skipping

During the burst mode, the converter continuously charges up the output capacitor until the output voltage reaches a certain limit threshold. The operation of the converter in this interval is equivalent to the peak inductor current mode control. In each switch period, the main switch is turned on until the inductor current reaches the peak current limit threshold. As the load increases the number of pulses increases to make sure that the output voltage stays within regulation limits. When the load is very light the low power controller has a zero crossing detector to allow the low side mosfet to operate even in light load conditions. The transistor is not disabled at light loads. A zero crossing detection circuit will disable it when inductor current reverses. During the whole process the body diode does not conduct but is used as blocking diode only.

During the skipping interval, the upper and lower transistors are turned off and the converter stays in idle mode. The output capacitors are discharged by the load current until the moment when the output voltage drops to a low threshold.

The choice of output filter will influence the performance of the low power circuit. The maximum ripple during low power mode can be calculated as:

$$V_{OUT\_RIPPLE} = \frac{K_{RIP} T_S}{C_{OUT}} \tag{9}$$

Where K_{RIP} is 1.4 for Buck1 and 0.7 for Buck2 and Buck3. TS can be calculated as:

$$T_S = \frac{0.35}{\left[\left(\frac{V_{IN} - V_{OUT}}{L}\right)\frac{V_{OUT}}{V_{IN}}\right]} \tag{10}$$

Power Dissipation

The total power dissipation inside TPS652510 should not to exceed the maximum allowable junction temperature of 125°C. The maximum allowable power dissipation is a function of the thermal resistance of the package (R_{JA}) and ambient temperature. To calculate the temperature inside the device under continuous loading use the following procedure:

1. Define the set voltage for each converter.
2. Define the continuous loading on each converter. Make sure do not exceed the converter maximum loading.
3. Determine from the graphs below the expected losses in watts per converter inside the device. The losses depend on the input supply, the selected switching frequency, the output voltage and the converter chosen.

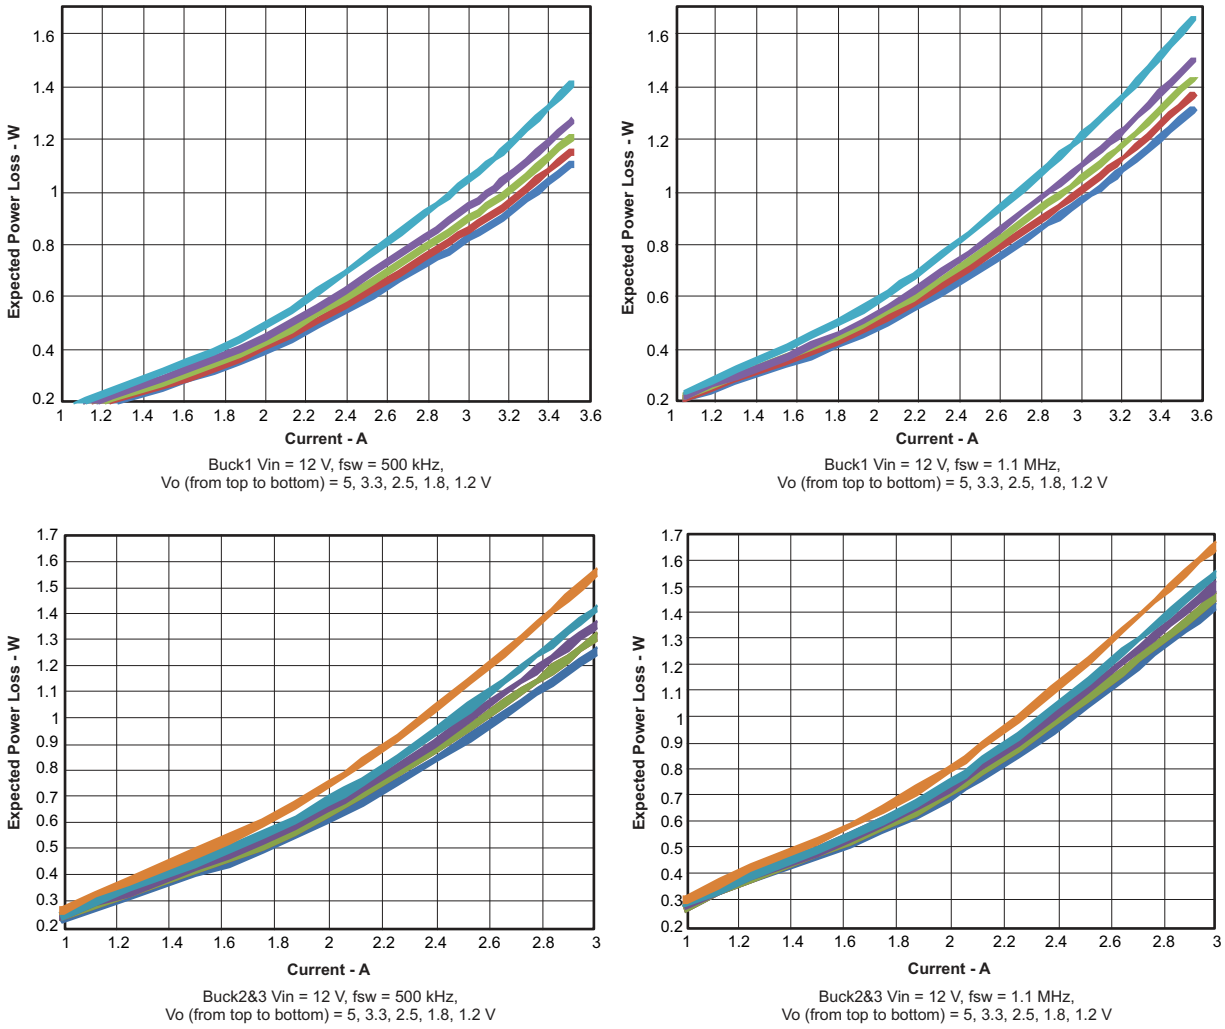

Figure 40. Power Dissipation Curves

4. To calculate the maximum temperature inside the IC use the following formula:

$$T_{HOT\_SPOT} = T_A + P_{DIS} \times \Theta_{JA} \quad (11)$$

Where:

T_A is the ambient temperature

P_{DIS} is the sum of losses in all converters

Θ_{JA} is the junction to ambient thermal impedance of the device and it is heavily dependant on board layout

Thermal Shutdown

The device implements an internal thermal shutdown to protect itself if the junction temperature exceeds 160°C. The thermal shutdown forces the device to stop switching when the junction temperature exceeds thermal trip threshold. Once the die temperature decreases below 140°C, the device reinitiates the power up sequence. The thermal shutdown hysteresis is 20°C.

3.3-V and 6.5 LDO Regulators

The following ceramic capacitor (X7R/X5R) should be connected as close as possible to the described pins:

- 4.7 µF to 10 µF for V7V pin 28
- 3.3 µF to 10 µF for V3V pin 29

Layout Recommendation

Layout is a critical portion of PMIC designs.

- Place tracing for output voltage and LX on the top layer and an inner power plane for VIN.
- Fit also on the top layer connections for the remaining pins of the PMIC and a large top side area filled with ground.
- The top layer ground area should be connected to the internal ground layer(s) using vias at the input bypass capacitor, the output filter capacitor and directly under the TPS652510 device to provide a thermal path from the PowerPad land to ground.
- For operation at full rated load, the top side ground area together with the internal ground plane, must provide adequate heat dissipating area.
- There are several signals paths that conduct fast changing currents or voltages that can interact with stray inductance or parasitic capacitance to generate noise or degrade the power supplies performance. To help eliminate these problems, the VIN pin should be bypassed to ground with a low ESR ceramic bypass capacitor with X5R or X7R dielectric. Care should be taken to minimize the loop area formed by the bypass capacitor connections, the VIN pins, and the ground connections. Since the LX connection is the switching node, the output inductor should be located close to the LX pins, and the area of the PCB conductor minimized to prevent excessive capacitive coupling.
- The output filter capacitor ground should use the same power ground trace as the VIN input bypass capacitor. Try to minimize this conductor length while maintaining adequate width.
- The compensation should be as close as possible to the CMPx pins. The CMPx and ROSC pins are sensitive to noise so the components associated to these pins should be located as close as possible to the IC and routed with minimal lengths of trace.

REVISION HISTORY

Changes from Revision A (September 2011) to Revision B **Page**

- Changed Functional Block Diagram image 3
- Changed Terminal Function descriptions for V7V and V3V 5
- Added F_PWM to Absolute Maximum Ratings 6
- Changed INPUT SUPPLY UVLO AND INTERNAL SUPPLY VOLTAGE parameters 7
- Added I_{3V} and I_{7V} limits 7
- Changed V_{IH} and V_{IL} limits 7
- Changed FEEDBACK, REGULATION, OUTPUT STAGE parameters 7
- Changed Equation 5 15
- Changed Type III Circuit description for first row 18
- Changed 18
- Changed Current Limit Protection section 19
- Changed Figure 36 19
- Changed Figure 37 19
- Changed Figure 38 20
- Changed current limit description 20
- Changed Figure 40 22
- Changed 3.3-V and 6.5 LDO Regulators section 22

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS652510RHAR	ACTIVE	VQFN	RHA	40	2500	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 85	TPS 652510	Samples
TPS652510RHAT	ACTIVE	VQFN	RHA	40	250	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 85	TPS 652510	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

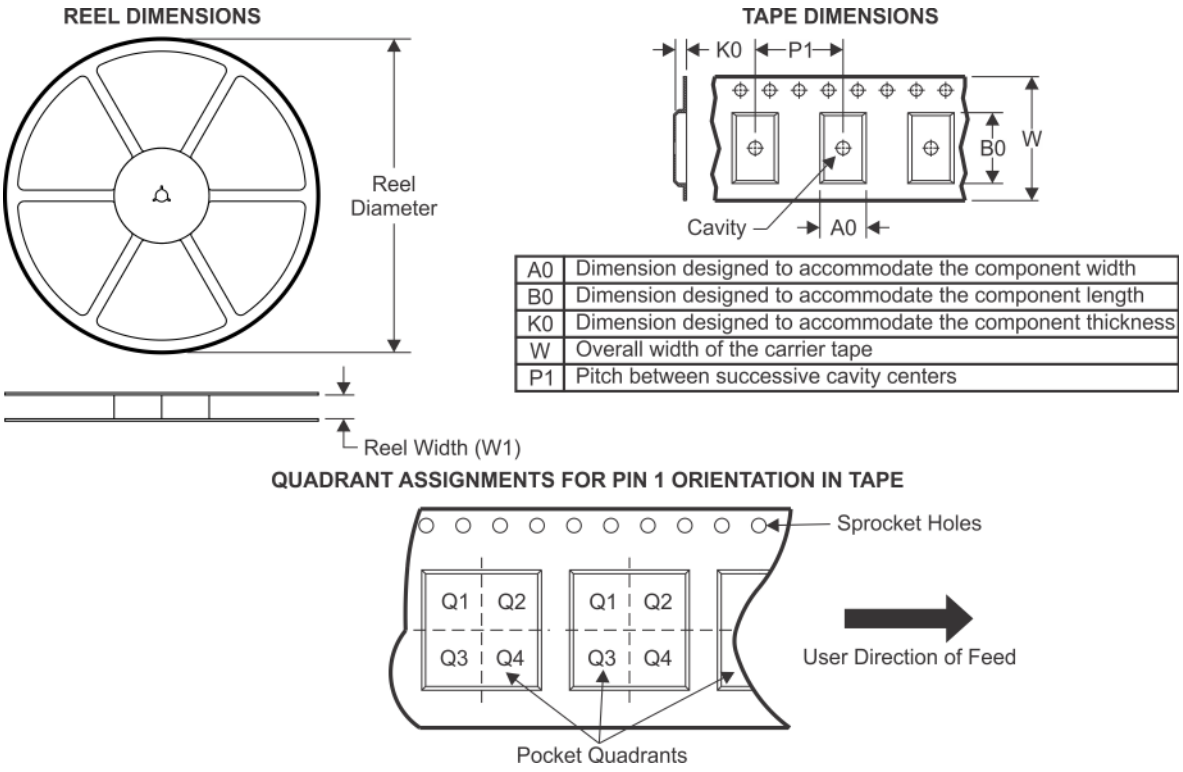
(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

TAPE AND REEL INFORMATION



A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
