

# 32K/64K × 16 Dual-Port Static RAM

#### **Features**

- True dual-ported memory cells which allow simultaneous access of the same memory location
- 32K × 16 organization (CY7C027)
- 64K × 16 organization (CY7C028)
- 0.35 micron CMOS for optimum speed and power
- High speed access: 15 and 20 ns
- Low operating power
- Active: I<sub>CC</sub> = 180 mA (typical)
- Standby: I<sub>SB3</sub> = 0.05 mA (typical)
- Fully asynchronous operation
- Automatic power down
- Expandable data bus to 32 bits or more using Master/Slave chip select when using more than one device
- On-chip arbitration logic
- Semaphores included to permit software handshaking between ports
- INT flags for port-to-port communication
- Separate upper-byte and lower-byte control
- Dual chip enables
- Pin select for Master or Slave
- Commercial and industrial temperature ranges
- Available in 100-pin TQFP
- Pb-free packages available

# **Functional Description**

The CY7C027 and CY7C028 are low power CMOS 32K, 64K × 16 dual-port static RAMs. Various arbitration schemes are included on the devices to handle situations when multiple processors access the same piece of data. Two ports are provided, permitting independent, asynchronous access for reads and writes to any location in memory. The devices can be used as standalone 16-bit dual-port static RAMs or multiple devices can be combined to function as a 32-bit or wider master/slave dual-port static RAM. An M/S pin is provided for implementing 32-bit or wider memory applications without the need for separate master and slave devices or additional discrete logic. Application areas include interprocessor and multiprocessor designs, communications status buffering, and dual-port video/graphics memory.

Each port has independent control  $\underline{pins}$ : dual chip enables  $(\overline{CE}_0)$  and  $CE_1$ , read or write enable (R/W), and output enable (OE). Two flags are provided on each port (BUSY) and  $\overline{INT}$ . BUSY signals that the port is trying to access the same location currently being accessed by the other port. The interrupt flag  $(\overline{INT})$  permits communication between ports or systems by means of a mail box. The semaphores are used to pass a flag, or token, from one port to the other to indicate that a shared resource is in use. The semaphore logic is comprised of eight shared latches. Only one side can control the latch (semaphore) at any time. Control of a semaphore indicates that a shared resource is in use. An automatic power down feature is controlled independently on each port by the chip enable pins.

The CY7C027 and CY7C028 are available in 100-pin Thin Quad Flat pack (TQFP) packages.

#### Notes

- 6. The voltage on any input or I/O pin cannot exceed the power pin during power up.7. Pulse width < 20 ns.</li>

<sup>8.</sup> f<sub>MAX</sub> = 1/t<sub>RC</sub> = All inputs cycling at f = 1/t<sub>RC</sub> (except output enable). f = 0 means no address or control lines change. This applies only to inputs at CMOS level standby I<sub>SB3</sub>.

# Capacitance

| Parameter [9]    | Description        | Test Conditions  | Max | Unit |
|------------------|--------------------|--|-----|------|
| C <sub>IN</sub>  | Input Capacitance  | $T_A = 25 ^{\circ}\text{C}, f = 1 \text{MHz}, V_{CC} = 5.0 \text{V}$ | 10  | pF   |
| C <sub>OUT</sub> | Output Capacitance |  | 10  | pF   |

#### **AC Test Loads and Waveforms**

Figure 2. AC Test Loads and Waveforms

- (a) Normal Load (Load 1)
- (b) Thévenin Equivalent (Load 1)
- (c) Three-State Delay (Load 2) (Used for t<sub>CKLZ</sub>, t<sub>OLZ</sub>, & t<sub>OHZ</sub> including scope and jig)

# ALL INPUT PULSES 3.0 V GND 10% 90% 10% $\le 3 \text{ ns}$

# **Data Retention Mode**

The CY7C027 and CY7C028 are designed with battery backup in mind. Data retention voltage and supply current are guaranteed over temperature. The following rules ensure data retention:

- 1. Chip enable ( $\overline{\text{CE}}$ ) must be held HIGH during data retention, within V<sub>CC</sub> to V<sub>CC</sub> 0.2 V.
- CE must be kept between V<sub>CC</sub> 0.2 V and 70% of V<sub>CC</sub> during the power up and power down transitions.
- 3. The RAM can begin operation >  $t_{RC}$  after  $V_{CC}$  reaches the minimum operating voltage (4.5 V).

# **Timing**

| Parameter          | Test Conditions [10]       | Max | Unit |
|--------------------|----------------------------|-----|------|
| ICC <sub>DR1</sub> | At VCC <sub>DR</sub> = 2 V | 1.5 | mA   |

#### Notes

9. Tested initially and after any design or process changes that may affect these parameters. 10.  $\overline{\text{CE}}$  = V<sub>CC</sub>, V<sub>IN</sub> = GND to V<sub>CC</sub>, T<sub>A</sub> = 25 °C. This parameter is guaranteed but not tested.

#### Notes

<sup>11.</sup> Test conditions assume signal transition time of 3 ns or less, timing reference levels of 1.5 V, input pulse levels of 0 to 3.0 V, and output loading of the specified I<sub>O</sub>/I<sub>OH</sub> and 30 pF load capacitance.

12. To access RAM, CE = L, UB = L, SEM = H. To access semaphore, CE = H and SEM = L. Either condition must be valid for the entire t<sub>SCE</sub> time.

<sup>13.</sup> At any given temperature and voltage condition for any given device,  $t_{HZCE}$  is less than  $t_{LZCE}$  and  $t_{HZOE}$  is less than  $t_{LZOE}$ .

<sup>14.</sup> Test conditions used are Load 2.

<sup>15.</sup> This parameter is guaranteed by design, but it is not production tested.

<sup>16.</sup> For information on port-to-port delay through RAM cells from writing port to reading port, refer to Figure 11 on page 13.

 $<sup>\</sup>label{eq:Notes} \textbf{17. Test conditions used are Load 1.} \\ \textbf{18. } t_{BDD} \text{ is a calculated parameter and is the greater of } t_{WDD} - t_{PWE} \text{ (actual) or } t_{DDD} - t_{SD} \text{ (actual)}.$ 

# **Switching Waveforms**

Figure 4. Read Cycle No. 1 (Either Port Address Access) [19, 20, 21]

Figure 5. Read Cycle No. 2 (Either Port CE/OE Access) [19, 22, 23]

Figure 6. Read Cycle No. 3 (Either Port)  $^{[19,\ 21,\ 22,\ 23]}$ 

- 19.  $R/\overline{W}$  is HIGH for read cycles.
- 20. <u>Device</u> is continuously selected  $\overline{CE} = V_{IL}$  and  $\overline{UB}$  or  $\overline{LB} = V_{IL}$ . This waveform cannot be used for semaphore reads.

- 21.  $\overline{OE} = V_{IL}$ .

  22. Address valid prior to or coincident with  $\overline{CE}$  transition LOW.

  23. To access RAM,  $\overline{CE} = V_{IL}$ ,  $\overline{UE} = V_{IL}$ ,  $\overline{UE}$

Figure 7. Write Cycle No. 1 (R/W Controlled Timing) [24, 25, 26, 27]

Figure 8. Write Cycle No. 2 ( $\overline{\text{CE}}$  Controlled Timing) [24, 25, 26, 31, 32]

#### Notes

- 24. R/W must be HIGH during all address transitions.
- 25. A write occurs during the overlap (t<sub>SCE</sub> or t<sub>PWE</sub>) of a LOW CE or SEM and a LOW UB or LB.

  26. t<sub>HA</sub> is measured from the earlier of CE or R/W or (SEM or R/W) going HIGH at the end of write cycle.
- 25. t<sub>HA</sub> Is measured from the earnier of CE or R/W or (SEM or R/W) going HIGH at the end of write cycle.
  27. If OE is LOW during a R/W controlled write cycle, the write pulse width\_must be the larger of t<sub>PWE</sub> or (t<sub>HZWE</sub> + t<sub>SD</sub>) to allow the I/O drivers to turn off and data to be placed on the bus for the required t<sub>SD</sub>. If OE is HIGH during an R/W controlled write cycle, this requirement does not apply and the write pulse can be as short as the specified t<sub>PWE</sub>.
  28. To access RAM, CE = V<sub>IL</sub>, SEM = V<sub>IH</sub>.
  29. To access upper byte, CE = V<sub>IL</sub>, UB = V<sub>IL</sub>, SEM = V<sub>IH</sub>.
  To access lower byte, CE = V<sub>IL</sub>, LB = V<sub>IL</sub>, SEM = V<sub>IH</sub>.
  20. Transition is measured ±500 mV from strady ctate with a 5 pE load (including score and iii). This parameter is sampled and not 100% tested.

- 30. Transition is measured ±500 mV from steady state with a 5 pF load (including scope and jig). This parameter is sampled and not 100% tested.
- 31. During this period, the I/O pins are in the output state, and input signals must not be applied.
- 32. If the  $\overline{\text{CE}}$  or  $\overline{\text{SEM}}$  LOW transition occurs simultaneously with or after the  $\overline{\text{R/W}}$  LOW transition, the outputs remain in the high impedance state.

Figure 9. Semaphore Read After Write Timing, Either Side  $^{[33]}$ 

Figure 10. Timing Diagram of Semaphore Contention [34, 35, 36]

- Notes 33.  $\overline{\text{CE}}$  = HIGH for the duration of the above timing (both write and read cycle). 34.  $I/O_{0R} = I/O_{0L} = \text{LOW}$  (request semaphore);  $\overline{\text{CE}}_R = \overline{\text{CE}}_L = \text{HIGH}$ . 35. Semaphores are reset (available to both ports) at cycle start.

- 36. If t<sub>SPS</sub> is violated, the semaphore is definitely obtained by one side or the other, but which side gets the semaphore is unpredictable.

#### Left Address Valid First:

# **Right Address Valid First:**

#### Note

38. If t<sub>PS</sub> is violated, the busy signal is asserted on one side or the other, but there is no guarantee to which side BUSY is asserted.

Figure 15. Interrupt Timing Diagrams Left Side Sets INT<sub>R</sub>: t<sub>WC</sub> -ADDRESS<sub>L</sub> WRITE 7FFF (FFFF for CY7C028) CEL  $R/\overline{W}_L$  $\overline{\text{INT}}_{\text{R}}$ t<sub>INS</sub>[40] Right Side Clears INT<sub>R</sub>:  $t_{RC}$ READ 7FFF (FFFF for CY7C028) ADDRESS<sub>R</sub>  $\overline{\text{CE}}_{\text{R}}$ t<sub>INR</sub>[40]  $R/\overline{W}_R$  $\overline{\mathsf{OE}}_\mathsf{R}$  $\overline{\mathsf{INT}}_\mathsf{R}$ Right Side Sets INT<sub>L</sub>:  $t_{WC}$  $ADDRESS_R$ WRITE 7FFE (FFFE for CY7C028) t<sub>HA</sub>[39]  $\overline{\text{CE}}_{\mathsf{R}}$  $R/\overline{W}_R$  $\overline{\mathsf{INT}}_{\mathsf{L}}$  $t_{INS}^{[40]}$ Left Side Clears INT<sub>L</sub>:  $t_{RC}$ READ 7FFE (FFFE for CY7C028)  $\mathsf{ADDRESS}_\mathsf{R}$  $\overline{\mathsf{CE}}_\mathsf{L}$ t<sub>INR</sub>[40]  $R/\overline{W}_{L}$ 

#### Notes

 $\overline{\mathsf{INT}}_\mathsf{L}$ 

<sup>39.</sup>  $t_{HA}$  depends on which enable pin  $(\overline{CE}_L \text{ or } \underline{R/W}_L)$  is deasserted first. 40.  $t_{INS}$  or  $t_{INR}$  depends on which enable pin  $(\overline{CE}_L \text{ or } R/\overline{W}_L)$  is asserted last.

#### **Architecture**

The CY7C027 and CY7C028 consist of an array of 32K and 64K words of 16 bits each of dual-port RAM cells, I/O and address lines, and control signals (CE, OE, R/W). These control pins permit independent access for reads or writes to any location in memory. To handle simultaneous writes/reads to the same location, a BUSY pin is provided on each port. Two interrupt (INT) pins can be used for port-to-port communication. Two semaphore (SEM) control pins are used for allocating shared resources. With the M/S pin, the devices can function as a master (BUSY pins are outputs) or as a slave (BUSY pins are inputs). The devices also have an automatic power down feature controlled by CE. Each port is provided with its own output enable control (OE), which allows data to be read from the device.

# **Functional Overview**

## **Write Operation**

Data must be set up for a duration of t<sub>SD</sub> before the rising edge of R/W to guarantee a valid write. A write operation is controlled by either the R/W pin (see Figure 7 on page 11) or the CE pin (see Figure 8 on page 11). Required inputs for non-contention operations are summarized in Table 1.

If a location is being written to by one port and the opposite port attempts to read that location, a port-to-port flowthrough delay must occur before the data is read on the output; otherwise the data read is not deterministic. Data is valid on the port t<sub>DDD</sub> after the data is presented on the other port.

Table 1. Non-Contending Read/Write

|    |     | Inp | uts |    |     | Ou                                  | ıtputs                             |  |

#### **Read Operation**

When reading the device, the user must assert both the  $\overline{\text{OE}}$  and  $\overline{\text{CE}}$  pins. Data is available t<sub>ACE</sub> after  $\overline{\text{CE}}$  or t<sub>DOE</sub> after  $\overline{\text{OE}}$  is

<u>asserted</u>. If the user wishes to access a se<u>maphore flag, then</u> the SEM pin must be asserted instead of the CE pin, and OE must also be asserted.

#### Interrupts

The upper two memory locations may be used for message passing. The highest memory location (7FFF for the CY7C027, FFFF for the CY7C028) is the mailbox for the right port and the second-highest memory location (7FFE for the CY7C027, FFFE for the CY7C028) is the mailbox for the left port. When one port writes to the other port's mailbox, an interrupt is generated to the owner. The interrupt is reset when the owner reads the contents of the mailbox. The message is user defined.

Each port can read the other port's mailbox without resetting the interrupt. The active state of the busy signal (to a port) prevents the port from setting the interrupt to the winning port. Also, an active busy to a port prevents that port from reading its own mailbox and, thus, resetting the interrupt to it.

If an application does not require message passing, do not connect the interrupt pin to the processor's interrupt request input pin.

The operation of the interrupts and their interaction with Busy is summarized in Table 2.

Table 2. Interrupt Operation Example (assumes  $\overline{BUSY}_L = \overline{BUSY}_R = HIGH)^{[41]}$ 

|                                   | Left Port        |    |    |                     | Right Port        |                  |     |     |                     |                   |
|-----------------------------------|------------------|----|----|---------------------|-------------------|------------------|-----|-----|---------------------|-------------------|
| Function                          | R/W <sub>L</sub> | CE | OE | A <sub>0L-14L</sub> | INT               | R/W <sub>R</sub> | CER | OER | A <sub>0R-14R</sub> | INT <sub>R</sub>  |
| Set Right INT <sub>R</sub> Flag   | L                | L  | Х  | 7FFF                | Х                 | Х                | Х   | Х   | Х                   | L <sup>[42]</sup> |
| Reset Right INT <sub>R</sub> Flag | Х                | Х  | Х  | Х                   | Х                 | Х                | L   | L   | 7FFF                | H <sup>[43]</sup> |

| Reset Left INT <sub>L</sub> Flag  | Х                | L  | L  | 7FFE                | H <sup>[42]</sup> | Х                | Х   | Х   | Х                   | Х                 |

#### Busy

The CY7C027 and CY7C028 provide on-chip arbitration to resolve simultaneous memory location access (contention). If both ports' CEs are asserted and an address match occurs within t<sub>PS</sub> of each other, the busy logic determines which port has access. If t<sub>PS</sub> is violated, one port definitely gains permission to the location, but it is not predictable which port gets that permission. BUSY is asserted t<sub>BLA</sub> after an address match or  $t_{BLC}$  after  $\overline{CE}$  is taken LOW.

#### Master/Slave

A M/S pin is provided to expand the word width by configuring the device as either a master or a slave. The BUSY output of the master is connected to the BUSY input of the slave. This allows the device to interface to a master device with no external components. Writing to slave devices must be delayed until after the BUSY input has settled (t<sub>BLC</sub> or t<sub>BLA</sub>), otherwise, the slave chip may begin a write cycle during a contention situation. When tied HIGH, the M/S pin allows the device to be used as a master and, therefore, the BUSY line is an output. BUSY can then be used to send the arbitration outcome to a slave.

#### **Semaphore Operation**

The CY7C027 and CY7C028 provide eight semaphore latches, which are separate from the dual-port memory locations. Semaphores are used to reserve resources that are shared between the two ports. The state of the semaphore indicates that a resource is in use. For example, if the left port wants to request a given resource, it sets a latch by writing a zero to a semaphore location. The left port then verifies its success in setting the latch by reading it. After writing to the semaphore, SEM or OE must be deasserted for t<sub>SOP</sub> before attempting to read the semaphore. The semaphore value is available t<sub>SWRD</sub> + t<sub>DOF</sub> after the rising edge of the semaphore write. If the left port was successful (reads a zero), it assumes control of the shared resource, otherwise (reads a one) it assumes the right port has control and continues to poll the semaphore. When the right side has relinquished control of the semaphore (by writing a one), the left side succeeds in gaining control of the semaphore. If the left side no longer requires the semaphore, a one is written to cancel its request.

Semaphores are accessed by asserting SEM LOW. The SEM pin functions as a chip select for the semaphore latches (CE must remain HIGH <u>dur</u>ing SEM LOW). A<sub>0-2</sub> represents the semaphore address. OE and R/W are used in the same manner as a normal memory access. When writing or reading a semaphore, the other address pins have no effect.

When writing to the semaphore, only I/O<sub>0</sub> is used. If a zero is written to the left port of an available semaphore, a one appears at the same semaphore address on the right port. That semaphore can now only be modified by the side showing zero (the left port in this case). If the left port now relinquishes control by writing a one to the semaphore, the semaphore is set to one for both sides. However, if the right port had requested the semaphore (written a zero) while the left port had control, the right port would immediately own the semaphore as soon as the left port released it. Table 3 shows sample semaphore operations.

When reading a semaphore, all sixteen/eighteen data lines output the semaphore value. The read value is latched in an output register to prevent the semaphore from changing state during a write from the other port. If both ports attempt to access the semaphore within t<sub>SPS</sub> of each other, the semaphore is definitely obtained by one side or the other, but there is no guarantee which side controls the semaphore.

#### Notes

<sup>41.</sup>  $A_{0L=15L}$  and  $A_{0R=15R}$ , FFFF/FFFE for the CY7C028. 42. If  $\underline{BUSY_L}=L$ , then no change.

<sup>43.</sup> If  $\overline{BUSY}_R = L$ , then no change.

Table 3. Semaphore Operation Example

| Function                         | I/O <sub>0</sub> -I/O <sub>15</sub> Left | I/O <sub>0</sub> -I/O <sub>15</sub> Right | Status   |
|----------------------------------|--|---|--|
| No action                        | 1  | 1   | Semaphore free   |
| Left port writes 0 to semaphore  | 0  | 1   | Left port has semaphore token                          |
| Right port writes 0 to semaphore | 0  | 1   | No change. Right side has no write access to semaphore |
| Left port writes 1 to semaphore  | 1  | 0   | Right port obtains semaphore token                     |
| Left port writes 0 to semaphore  | 1  | 0   | No change. Left port has no write access to semaphore  |
| Right port writes 1 to semaphore | 0  | 1   | Left port obtains semaphore token                      |
| Left port writes 1 to semaphore  | 1  | 1   | Semaphore free   |
| Right port writes 0 to semaphore | 1  | 0   | Right port has semaphore token                         |
| Right port writes 1 to semaphore | 1  | 1   | Semaphore free   |
| Left port writes 0 to semaphore  | 0  | 1   | Left port has semaphore token                          |
| Left port writes 1 to semaphore  | 1  | 1   | Semaphore free   |
