

FAN1587A

3A Adjustable/Fixed Low Dropout Linear Regulator

Features

- Fast transient response
- Low dropout voltage at up to 3A
- Load regulation: 0.05% typical
- Trimmed current limit
- On-chip thermal limiting
- Standard TO-220, TO-263, TO-263 center cut, and TO-252 packages

Applications

- Pentium® Class GTL+ bus supply
- Low voltage logic supply
- Post regulator for switching supply
- 12V to 5V linear regulator
- 3.3V to 1.5V linear regulator

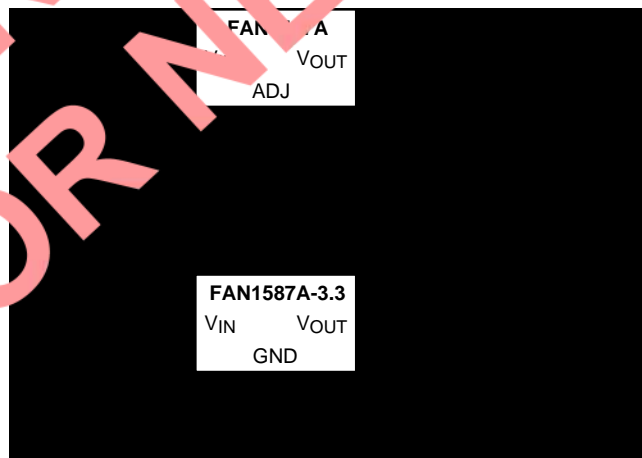

Description

The FAN1587A, FAN1587A-1.5, and FAN1587A-3.3 are low dropout three-terminal regulators with 3A output current capability. These devices have been optimized for low voltage applications including VTT bus applications where transient response and minimum input voltage are critical. The FAN1587A is ideal for low voltage microprocessor applications requiring a regulated output from 1.5V to 3.6V with an input supply of 12V or less. The FAN1587A-1.5 offers fixed 1.5V with 3A current capability for GTL+ bus VTT termination. The FAN1587A-3.3 offers fixed 3.3V current capability for logic C operation.

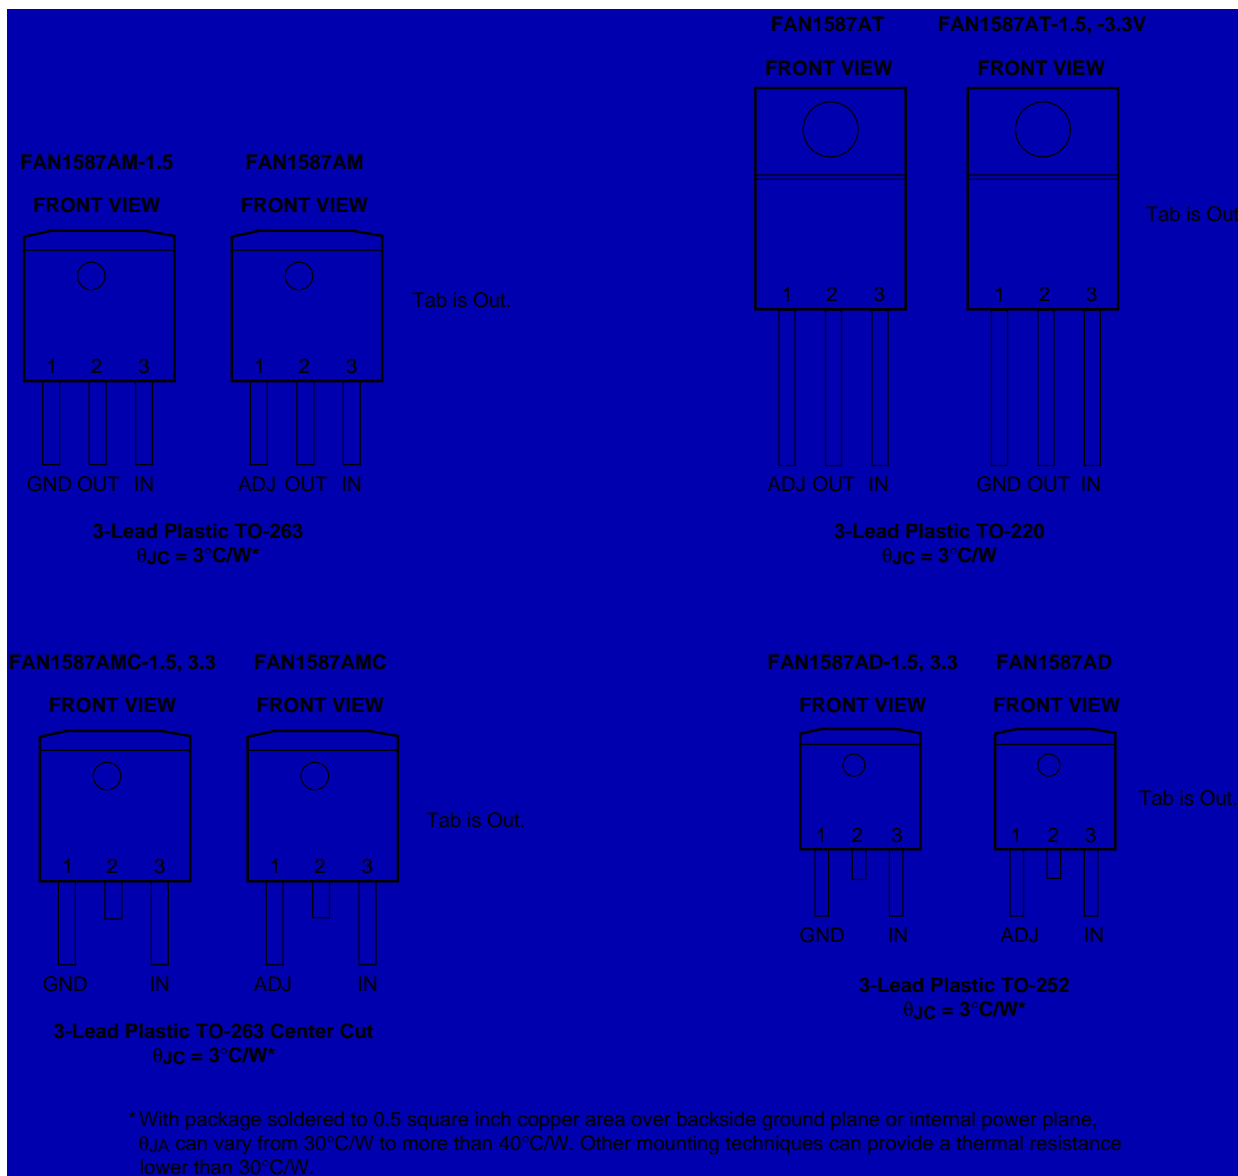

Current limit is trimmed to ensure specified output current and controlled short-circuit current. On-chip thermal limiting provides protection against any combination of overload and ambient temperature that would create excessive junction temperatures.

The FAN1587A, FAN1587A-1.5, and FAN1587A-3.3 are available in the industry-standard TO-220, TO-263, TO-263 center cut, and TO-252 (DPAK) power packages.

Typical Applications

Pin Assignments

Absolute Maximum Ratings

Parameter	Min.	Max.	Unit
V _{IN}		18	V
(V _{IN} – V _{OUT}) * I _{OUT}		See Figure 1	
Operating Junction Temperature Range	0	125	°C
Storage Temperature Range	-65	150	°C
Lead Temperature (Soldering, 10 sec.)		300	°C

Figure 1. Absolute Maximum Safe Operating Area

Electrical Characteristics

T_j = 25°C unless otherwise specified.

The • denotes specifications which apply over the specified operating temperature range.

Parameter	Conditions		Min.	Typ.	Max	Units
Reference Voltage ³	$1.5V \leq (V_{IN} - V_{OUT}) \leq 8.25V$, $10mA \leq I_{OUT} \leq 3A$	•	1.225 (-2%)	1.250	1.275 (+2%)	V
Output Voltage ^{4, 6}	$3.0V \leq V_{IN} \leq 8.5V$ $10mA \leq I_{OUT} \leq 3A$	•	1.47	1.5	1.53	V
Output Voltage ^{5, 6}	$4.8V \leq V_{IN} \leq 10.3V$ $10mA \leq I_{OUT} \leq 3A$	•	3.234	3.3	3.366	V
Line Regulation ^{1, 2}	$(V_{OUT} + 1.5V) \leq V_{IN} \leq 12V$, $I_{OUT} = 10mA$	•		0.005	0.2	%
Load Regulation ^{1, 2}	$(V_{IN} - V_{OUT}) = 3V$ $10mA \leq I_{OUT} \leq 3A$	•		0.05	0.5	%
Dropout Voltage	$\Delta V_{REF} = 1\%$, $I_{OUT} = 3A$	•		1.150	1.300	V
Current Limit	$(V_{IN} - V_{OUT}) = 2V$	•	3.1	4		A
Adjust Pin Current ³		•		35	120	μA
Adjust Pin Current Change ^{3, 6}	$1.5V \leq (V_{IN} - V_{OUT}) \leq 12V$, $10mA \leq I_{OUT} \leq 3A$	•		0.2	5	μA
Minimum Load Current	$1.5V \leq (V_{IN} - V_{OUT}) \leq 12V$	•	10			mA
Quiescent Current	$V_{IN} = 5V$	•		4	13	mA
Ripple Rejection	$f = 120Hz$, $C_{OUT} = 22\mu F$ Tantalum, $(V_{IN} - V_{OUT}) = 3V$, $I_{OUT} = 3A$		60	72		dB
Thermal Regulation	$T_A = 25^\circ C$, 30ms pulse			0.004	0.02	%/W
Temperature Stability		•		0.5		%
Long-Term Stability	$T_A = 125^\circ C$, 1000 hrs.			0.03	1.0	%
RMS Output Noise (% of V _{OUT})	$T_A = 25^\circ C$, $10Hz \leq f \leq 10kHz$			0.003		%
Thermal Resistance, Junction to Case	TO-220			3		°C/W
	TO-263, TO-252			3		°C/W
Thermal Shutdown				150		°C

Notes:

- See thermal regulation specifications for changes in output voltage due to heating effects. Load and line regulation are measured at a constant junction temperature by low duty cycle pulse testing.
- Line and load regulation are guaranteed up to the maximum power dissipation (18W). Power dissipation is determined by input/output differential and the output current. Guaranteed maximum output power will not be available over the full input/output voltage range.
- FAN1587A only.
- FAN1587A-1.5 only.
- FAN1587A-3.3 only.
- Output current must be limited to meet the absolute maximum ratings of the part.

Applications Information

General

The FAN1587A, FAN1587A-1.5, and FAN1587A-3.3 are three-terminal regulators optimized for GTL+ VTT termination applications. These devices are short-circuit protected, and offer thermal shutdown to turn off the regulator when the junction temperature exceeds about 150°C. The FAN1587A series provides low dropout voltage and fast transient response. Frequency compensation uses capacitors with low ESR while still maintaining stability. This is critical in addressing the needs of low voltage high speed microprocessor buses like GTL+.

Stability

The FAN1587A series require an output capacitor as a part of the frequency compensation. It is recommended to use a 22 μ F solid tantalum or a 100 μ F aluminum electrolytic on the output to ensure stability. The frequency compensation of these devices optimizes the frequency response with low ESR capacitors. It is recommended to use bypass capacitors such as a 22 μ F tantalum or a 100 μ F aluminum on the adjust pin of the FAN1587A for low ripple and fast transient response. When these bypassing capacitors are not used at the adjust pin, larger values of output capacitors provide equally good results. Refer to Typical Performance Characteristics for graph of stability of output capacitance ESR vs load current.

Protection Diodes

In normal operation, the FAN1587A series does not require any protection diodes. For the FAN1587A, internal resistors limit internal current paths on the adjust pin. Therefore, even with bypass capacitors on the adjust pin, no protection diode is needed to ensure device safety under shortcircuit conditions.

A protection diode between the input and output pins is usually not needed. An internal diode between the input and output pins on the FAN1587A series can handle microsecond surge currents of 50A to 100A. Even with large value output capacitors it is difficult to obtain those values of surge currents in normal operation. Only with large values of output capacitance, such as 1000 μ F to 5000 μ F, and with the input pin instantaneously shorted to ground can damage occur. A crowbar circuit at the input can generate those levels of current; a diode from output to input is then recommended, as shown in Figure 11. Usually, normal power supply cycling or system “hot plugging and unplugging” will not generate current large enough to do any damage.

The adjust pin can be driven on a transient basis ± 7 V with respect to the output, without any device degradation. As with any IC regulator, exceeding the maximum input-to-output voltage differential causes the internal transistors to break down and none of the protection circuitry is then functional.

Figure 11. Optional Protection

Ripple Rejection

In applications that require improved ripple rejection, a bypass capacitor from the adjust pin of the FAN1587A to ground reduces the output ripple by the ratio of $V_{OUT}/1.25$ V. The impedance of the adjust pin capacitor at the ripple frequency should be less than the value of R1 (typically in the range of 100 Ω to 120 Ω) in the feedback divider network in Figure 11. Therefore, the value of the required adjust pin capacitor is a function of the input ripple frequency. For example, if R1 equals 100 Ω and the ripple frequency equals 120Hz, the adjust pin capacitor should be 22 μ F. At 10kHz, only 0.22 μ F is needed.

Output Voltage

The FAN1587A regulator develops a 1.25V reference voltage between the output pin and the adjust pin (see Figure 12). Placing a resistor R1 between these two terminals causes a constant current to flow through R1 and down through R2 to set the overall output voltage. Normally, this current is the specified minimum load current of 10mA.

The current out of the adjust pin adds to the current from R1 and is typically 35 μ A. Its output voltage contribution is small and only needs consideration when very precise output voltage setting is required.

Figure 12. Basic Regulator Circuit

Load Regulation

It is not possible to provide true remote load sensing because the FAN1587A series are three-terminal devices. Load regulation is limited by the resistance of the wire connecting the regulators to the load. Load regulation per the data sheet specification is measured at the bottom of the package.

For fixed voltage devices, negative side sensing is a true Kelvin connection with the ground pin of the device returned to the negative side of the load. This is illustrated in Figure 13.

Figure 13. Connection for Best Load Regulation

For adjustable voltage devices, negative side sensing is a true Kelvin connection with the bottom of the output divider returned to the negative side of the load. The best load regulation is obtained when the top of resistor divider R1 connects directly to the regulator output and not to the load. Figure 14 illustrates this point.

If R1 connects to the load, then the effective resistance between the regulator and the load would be:

$$R_P \times (1 + R_2/R_1), R_P = \text{Parasitic Line Resistance}$$

The connection shown in Figure 14 does not multiply R_P by the divider ratio. As an example, R_P is about four milliohms per foot with 16-gauge wire. This translates to 4mV per foot at 1A load current. At higher load currents, this drop represents a significant percentage of the overall regulation. It is important to keep the positive lead between the regulator and the load as short as possible and to use large wire or PC board traces.

Figure 14. Connection for Best Load Regulation

Thermal Considerations

The FAN1587A series protect themselves under overload conditions with internal power and thermal limiting circuitry. However, for normal continuous load conditions, do not exceed maximum junction temperature ratings. It is important to consider all sources of thermal resistance from junction-to-ambient. These sources include the junction-to-case resistance, the case-to-heat sink interface resistance, and the heat sink resistance. Thermal resistance specifications have been developed to more accurately reflect device temperature and ensure safe operating temperatures.

For example, look at using an FAN1587AT to generate 3A @ 1.5V ± 2% from a 3.3V source (3.2V to 3.6V).

Assumptions:

- $V_{IN} = 3.6V$ worst case
- $V_{OUT} = 1.46V$ worst case
- $I_{OUT} = 3A$ continuous
- $T_A = 70^\circ C$
- $\theta_{Case-to-Ambient} = 3^\circ C/W$ (assuming both a heatsink and a thermally conductive material)

The power dissipation in this application is:

$$P_D = (V_{IN} - V_{OUT}) * (I_{OUT}) = (3.6 - 1.46) * (3) = 6.42W$$

From the specification table:

$$T_J = T_A + (P_D) * (\theta_{Case-to-Ambient} + \theta_{JC}) = 70 + (6.42) * (3 + 3) = 109^\circ C$$

The junction temperature is below the maximum rating.

Junction-to-case thermal resistance is specified from the IC junction to the bottom of the case directly below the die. This is the lowest resistance path for heat flow. Proper mounting ensures the best thermal flow from this area of the package to the heat sink. Use of a thermally conductive material at the

case-to-heat sink interface is recommended. Use a thermally conductive spacer if the case of the device must be electrically isolated and include its contribution to the total thermal resistance. The cases of the FAN1587A series are directly connected to the output of the device.
