

# ARTESYN DS495SPE

495 Watts Distributed Power System

Advanced Energy's Artesyn DS495SPE is housed in 1U high rack-mounting enclosures measuring just 3.4 x 7.7 inches (86.3 x 196.5 mm). This form factor is significantly shorter than that of similarly rated earlier-generation power supplies — freeing up valuable system space — and is achieved by use of the latest power switching technology and high density component packaging techniques.

## CONTROL AND STATUS SIGNALS

Input Signals			
<b>PSON_L</b>			
Active LOW signal which enables/disables the main output. Pulling this signal LOW will turn-on the main output. It is recommended that this pin is connected to a 100pF decoupling capacitor and pulled down by a 3.0K ohm resistor.			
		MIN	MAX
V <sub>IL</sub>	Input logic level LOW		0.4 V
V <sub>IH</sub>	Input logic level HIGH	2.06 V	3.0 V
I <sub>SOURCE</sub>	Current that may be sourced by this pin at low state		1 mA
<b>PSKILL_L</b>			
First break/last mate active high signal which enables/disables the main output. When driven high, the main output shall be turned-off.			
		MIN	MAX
V <sub>IL</sub>	Input logic level LOW		0.4 V
V <sub>IH</sub>	Input logic level HIGH	2.4 V	3.0 V
I <sub>SOURCE</sub>	Current that may be sourced by this pin at low state		1.0 mA
Output Signals			
<b>ACOK</b>			
Signal used to indicate the presence of AC input to the power supply. A logic level HIGH will indicate that the AC input to the power supply is within the operating range while a logic level LOW will indicate that AC has been lost. This is an open collector/drain output.			
		MIN	MAX
V <sub>oL</sub>	Output logic level LOW		0.6 V
V <sub>oH</sub>	Output logic level HIGH	2.0 V	3.0 V
I <sub>SOURCE</sub>	Current that may be sourced by this pin		4.0 mA
<b>PWR_GOOD/PWOK</b>			
Signal used to indicate that main output voltage is within regulation range. The PWR_GOOD signal will be driven HIGH when the output voltage is valid and will be driven LOW when the output falls below the under-voltage threshold. This signal also gives an advance warning when there is an impending power loss due to loss of AC input or system shutdown request. More details in the Timing Section. This is an open collector/drain output. It is recommended that this pin be connected to a 100 pF decoupling capacitor and pulled down by a 10 kohm resistor.			
		MIN	MAX
V <sub>oL</sub>	Output logic level LOW		0.4 V
V <sub>oH</sub>	Output logic level HIGH	2.0 V	3.0 V
I <sub>SINK</sub>	Current that may be sunk by this pin		10.0 mA

## CONTROL AND STATUS SIGNALS (CONTINUED)

Output Signals			
PS_PRESENT			
Signal used to indicate to the system that a power supply is inserted in the power bay. This pin is connected to the standby return in the power supply through a 220 ohm resistor. Recommended pull-up resistor to 12 VSB is 8.2 k with a 3.0 k pull-down to ground. A 100 pF decoupling capacitor is also recommended.			
PS_INTERRUPT_L			
Active low signal used by the power supply to indicate to the system that a change in power supply status has occurred. This event can be triggered by faults such as OVP, OCP, OTP, and fan fault. This signal can be cleared by a CLEAR_FAULT command. Recommended pull-up resistor to 12 VSB is 8.2 k with a 3.0 k pull-down to ground. A 100 pF decoupling capacitor is also recommended.			
		MIN	MAX
V <sub>OL</sub>	Output logic level LOW		0.8 V
V <sub>OH</sub>	Output logic level HIGH	2.0 V	3.0 V
I <sub>SOURCE</sub>	Current that may be sourced by this pin		4 mA
I <sub>SINK</sub>	Current that may be sunk by this pin at low state		4 mA
BUS Signals			
ISHARE			
Bus signal used by the power supply for active current sharing. All power supplies configured in the system for n+n sharing will refer to this bus voltage in order to load share.			
Voltage Range	The range of this signal for active sharing will be up to 8.0 V, which corresponds to the maximum output current.		
		MIN	MAX
I <sub>SHARE</sub> Voltage	Voltage at 100% load, stand-alone unit	7.75	8.25
	Voltage at 50% load, stand-alone unit	3.85	4.15
	Voltage at 0% load, stand-alone unit	0	0.35
SCL, SDA			
Clock and data signals defined as per I <sup>2</sup> C requirements.			
VL	Input logic level LOW		0.8 V
VH	Input logic level HIGH	2.0 V	3.0 V

Note: All signal noise levels are below 400 mVpk-pk from 0 - 100 MHz.

I<sup>2</sup>C Addressing Table: Not applicable. This power supply has a fixed I<sup>2</sup>C address. In order to support multiple addresses, the system will have to utilize a switcher or an I<sup>2</sup>C expander.
