STK22C48

16-Kbit (2 K × 8) AutoStore™ nvSRAM

Features

- 25 ns and 45 ns access times
- Hands off automatic STORE on power-down with external 68 µF capacitor
- STORE to QuantumTrap™ nonvolatile elements is initiated by software, hardware, or AutoStore™ on power-down
- RECALL to SRAM initiated by software or power-up
- Unlimited read, write, and RECALL cycles
- 1,000,000 STORE cycles to QuantumTrap
- 100 year data retention to QuantumTrap
- Single 5 V +10% operation
- Commercial and industrial temperatures
- 28-pin 300 mil and (330 mil) Small outline integrated circuit (SOIC) package
- Restriction of hazardous substances (RoHS) compliant

Functional Description

The Cypress STK22C48 is a fast static RAM with a nonvolatile element in each memory cell. The embedded nonvolatile elements incorporate QuantumTrap technology producing the world's most reliable nonvolatile memory. The SRAM provides unlimited read and write cycles, while independent nonvolatile data resides in the highly reliable QuantumTrap cell. Data transfers from the SRAM to the nonvolatile elements (the STORE operation) takes place automatically at power-down. On power-up, data is restored to the SRAM (the RECALL operation) from the nonvolatile memory. A hardware STORE is initiated with the $\overline{HSB}$ pin.

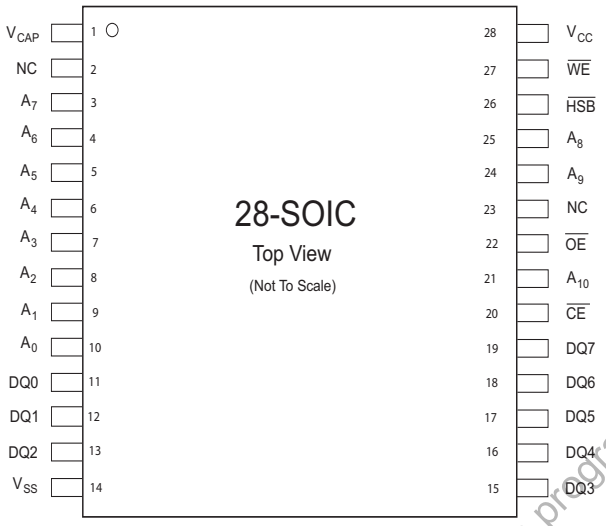
Pin Configurations

Figure 1. Pin Diagram - 28-pin SOIC



Not Recommended for New Designs.
In production for ongoing production programs only.

Table 1. Pin Definitions

Pin Name	Alt	IO Type	Description
A_0–A_{10}		Input	**Address inputs.** Used to select one of the 2,048 bytes of the nvSRAM.
DQ_0–DQ_7		Input or output	**Bidirectional data IO lines**. Used as input or output lines depending on operation.
$\overline{WE}$	$\overline{W}$	Input	**Write enable input, active LOW**. When the chip is enabled and $\overline{WE}$ is LOW, data on the IO pins is written to the specific address location.
$\overline{CE}$	$\overline{E}$	Input	**Chip enable input, active LOW**. When LOW, selects the chip. When HIGH, deselects the chip.
$\overline{OE}$	$\overline{G}$	Input	**Output enable, active LOW**. The active LOW $\overline{OE}$ input enables the data output buffers during read cycles. Deasserting $\overline{OE}$ HIGH causes the IO pins to tri-state.
V_{SS}		Ground	**Ground for the device**. The device is connected to ground of the system.
V_{CC}		Power supply	**Power supply inputs to the device**.
$\overline{HSB}$		Input or output	**Hardware Store Busy (HSB)**. When LOW, this output indicates a Hardware Store is in progress. When pulled low external to the chip, it initiates a nonvolatile STORE operation. A weak internal pull-up resistor keeps this pin high if not connected (connection optional).
V_{CAP}		Power supply	**AutoStore capacitor**. Supplies power to nvSRAM during power loss to store data from SRAM to nonvolatile elements.
NC		No connect	**No connect**. This pin is not connected to the die.

[+] Feedback

Device Operation

The STK22C48 nvSRAM is made up of two functional components paired in the same physical cell. These are an SRAM memory cell and a nonvolatile QuantumTrap cell. The SRAM memory cell operates as a standard fast static RAM. Data in the SRAM is transferred to the nonvolatile cell (the STORE operation) or from the nonvolatile cell to SRAM (the RECALL operation). This unique architecture enables the storage and recall of all cells in parallel. During the STORE and RECALL operations, SRAM Read and Write operations are inhibited. The STK22C48 supports unlimited reads and writes similar to a typical SRAM. In addition, it provides unlimited RECALL operations from the nonvolatile cells and up to one million STORE operations.

SRAM Read

The STK22C48 performs a Read cycle whenever $\overline{CE}$ and $\overline{OE}$ are LOW while $\overline{WE}$ and $\overline{HSB}$ are HIGH. The address specified on pins A_{0-10} determines the 2,048 data bytes accessed. When the Read is initiated by an address transition, the outputs are valid after a delay of t_{AA} (Read cycle 1). If the Read is initiated by $\overline{CE}$ or $\overline{OE}$, the outputs are valid at t_{ACE} or at t_{DOE}, whichever is later (Read cycle 2). The data outputs repeatedly respond to address changes within the t_{AA} access time without the need for transitions on any control input pins, and remains valid until another address change or until $\overline{CE}$ or $\overline{OE}$ is brought HIGH, or $\overline{WE}$ or $\overline{HSB}$ is brought LOW.

SRAM Write

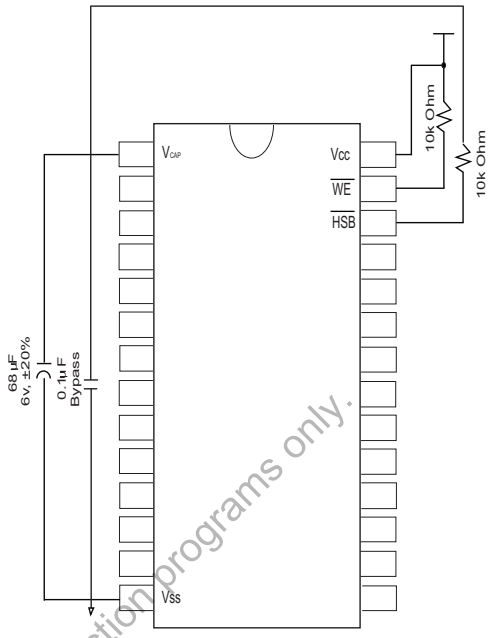
A Write cycle is performed whenever $\overline{CE}$ and $\overline{WE}$ are LOW and HSB is HIGH. The address inputs must be stable prior to entering the Write cycle and must remain stable until either $\overline{CE}$ or $\overline{WE}$ goes HIGH at the end of the cycle. The data on the common I/O pins DQ_{0-7} are written into the memory if it has valid t_{SD}, before the end of a $\overline{WE}$ controlled Write or before the end of an $\overline{CE}$ controlled Write. Keep $\overline{OE}$ HIGH during the entire Write cycle to avoid data bus contention on common I/O lines. If $\overline{OE}$ is left LOW, internal circuitry turns off the output buffers t_{HZWE} after $\overline{WE}$ goes LOW.

AutoStore Operation

During normal operation, the device draws current from V_{CC} to charge a capacitor connected to the V_{CAP} pin. This stored charge is used by the chip to perform a single STORE operation. If the voltage on the V_{CC} pin drops below V_{SWITCH}, the part automatically disconnects the V_{CAP} pin from V_{CC}. A STORE operation is initiated with power provided by the V_{CAP} capacitor.

Figure 2 shows the proper connection of the storage capacitor (V_{CAP}) for automatic store operation. A charge storage capacitor between 68 µF and 220 µF (±20%) rated at 6 V should be

Figure 2. AutoStore Mode



In system power mode, both V_{CC} and V_{CAP} are connected to the +5 V power supply without the 68 µF capacitor. In this mode, the AutoStore function of the STK22C48 operates on the stored system charge as power goes down. The user must, however, guarantee that V_{CC} does not drop below 3.6 V during the 10 ms STORE cycle.

To prevent unneeded STORE operations, automatic STOREs and those initiated by externally driving $\overline{HSB}$ LOW are ignored, unless at least one WRITE operation takes place since the most recent STORE or RECALL cycle. An optional pull-up resistor is shown connected to $\overline{HSB}$. This is used to signal the system that the AutoStore cycle is in progress.

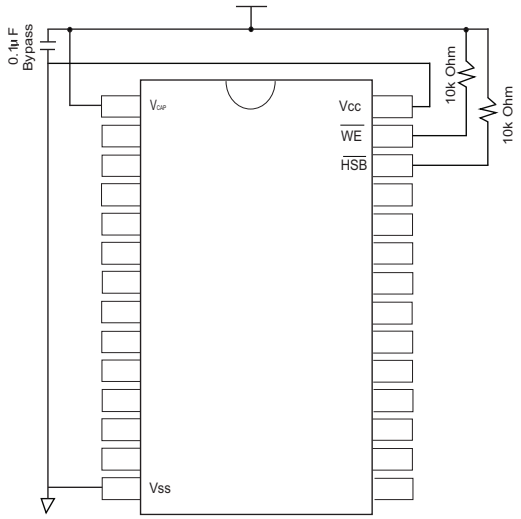
AutoStore Inhibit mode

If an automatic STORE on power loss is not required, then V_{CC} is tied to ground and +5 V is applied to V_{CAP} (Figure 3 on page 5). This is the AutoStore Inhibit mode, where the AutoStore function is disabled. If the STK22C48 is operated in this configuration, references to V_{CC} are changed to V_{CAP} throughout this data sheet. In this mode, STORE operations are triggered with the $\overline{HSB}$ pin. It is not permissible to change between these three options “on the fly”.

Not Recommended for New Designs.
In production to support ongoing production programs only.

[+] Feedback

Figure 3. AutoStore Inhibit Mode



Hardware STORE (HSB) Operation

The STK22C48 provides the HSB pin for controlling and acknowledging the STORE operations. The HSB pin is used to request a hardware STORE cycle. When the HSB pin is driven LOW, the STK22C48 conditionally initiates a STORE operation after t_{DELAY}. An actual STORE cycle only begins if a Write to the SRAM takes place since the last STORE or RECALL cycle. The HSB pin also acts as an open drain driver that is internally driven LOW to indicate a busy condition, while the STORE (initiated by any means) is in progress. Pull-up this pin with an external 10 K ohm resistor to V_{CAP} if HSB is used as a driver.

SRAM Read and Write operations, that are in progress when HSB is driven LOW by any means, are given time to complete before the STORE operation is initiated. After HSB goes LOW, the STK22C48 continues SRAM operations for t_{DELAY}. During t_{DELAY}, multiple SRAM Read operations take place. If a Write is in progress when HSB is pulled LOW, it allows a time, t_{DELAY} to complete. However, any SRAM Write cycles requested after HSB goes LOW are inhibited until HSB returns HIGH.

During any STORE operation, regardless of how it is initiated, the STK22C48 continues to drive the HSB pin LOW, releasing it only when the STORE is complete. After completing the STORE operation, the STK22C48 remains disabled until the HSB pin returns HIGH.

If HSB is not used, it is left unconnected.

Hardware RECALL (Power Up)

During power-up or after any low power condition (V_{CC} < V_{RESET}), an internal RECALL request is latched. When V_{CC} once again exceeds the sense voltage of V_{SWITCH}, a RECALL cycle is automatically initiated and takes $t_{HRECALL}$ to complete.

Data Protection

The STK22C48 protects data from corruption during low voltage conditions by inhibiting all externally initiated STORE and Write operations. The low voltage condition is detected when V_{CC} is less than V_{SWITCH}. If the STK22C48 is in a Write mode (both CE and WE are low) at power-up after a RECALL or after a STORE, the Write is inhibited until a negative transition on CE or WE is detected. This protects against inadvertent writes during power-up or brown out conditions.

Noise Considerations

The STK22C48 is a high speed memory. It must have a high frequency bypass capacitor of approximately 0.1 µF connected between V_{CC} and V_{SS}, using leads and traces that are as short as possible. As with all high speed CMOS ICs, careful routing of power, ground, and signals reduce circuit noise.

Hardware Protect

The STK22C48 offers hardware protection against inadvertent STORE operation and SRAM Writes during low voltage conditions. When V_{CAP}<V_{SWITCH}, all externally initiated STORE operations and SRAM Writes are inhibited. AutoStore can be completely disabled by tying V_{CC} to ground and applying +5 V to V_{CAP}. This is the AutoStore Inhibit mode; in this mode, STOREs are only initiated by explicit request using either the software sequence or the HSB pin.

Low Average Active Power

CMOS technology provides the STK22C48 the benefit of drawing significantly less current when it is cycled at times longer than 50 ns. Figure 4 on page 6 shows the relationship between I_{CC} and Read or Write cycle time. Worst case current consumption is shown for both CMOS and TTL input levels (commercial temperature range, VCC = 5.5 V, 100% duty cycle on chip enable). Only standby current is drawn when the chip is disabled. The overall average current drawn by the STK22C48 depends on the following items:

- The duty cycle of chip enable
- The overall cycle rate for accesses
- The ratio of Reads to Writes
- CMOS versus TTL input levels
- The operating temperature
- The V_{CC} level
- I/O loading

[+] Feedback

Figure 4. Current Versus Cycle Time (Read)

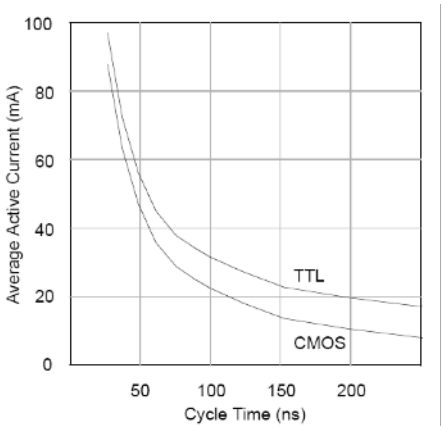

Figure 5. Current Versus Cycle Time (Write)

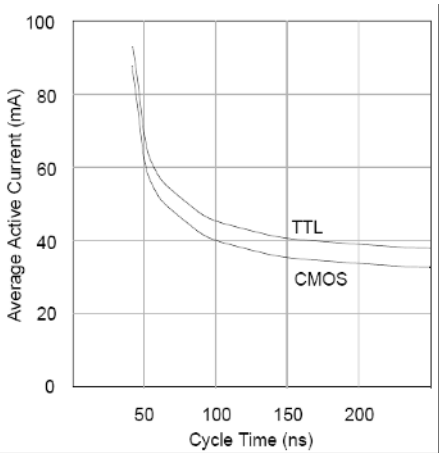

Preventing Store

The STORE function is disabled by holding $\overline{HSB}$ high with a driver capable of sourcing 30 mA at a V_{OH} of at least 2.2 V, because it must overpower the internal pull-down device. This device drives $\overline{HSB}$ LOW for 20 ns at the onset of a STORE. When the STK22C48 is connected for AutoStore operation (system V_{CC} connected to V_{CC} and a 68 μF capacitor on V_{CAP}) and V_{CC} crosses V_{SWITCH} on the way down, the STK22C48 attempts to pull HSB LOW. If HSB does not actually get below V_{IL}, the part stops trying to pull HSB LOW and abort the STORE attempt.

Best Practices

nvSRAM products have been used effectively for over 15 years. While ease of use is one of the product's main system values, experience gained working with hundreds of applications has resulted in the following suggestions as best practices:

- The nonvolatile cells in an nvSRAM are programmed on the test floor during final test and quality assurance. Incoming inspection routines at customer or contract manufacturer's sites sometimes reprogram these values. Final NV patterns are typically repeating patterns of AA, 55, 00, FF, A5, or 5A. The end product's firmware should not assume that an NV array is in a set programmed state. Routines that check memory content values to determine first time system configuration, cold or warm boot status, and so on must always program a unique NV pattern (for example, complex 4-byte pattern of 46 E6 49 53 hex or more random bytes) as part of the final system manufacturing test to ensure these system routines work consistently.
- Power-up boot firmware routines should rewrite the nvSRAM into the desired state. While the nvSRAM is shipped in a preset state, best practice is to again rewrite the nvSRAM into the desired state as a safeguard against events that might flip the bit inadvertently (program bugs, incoming inspection routines, and so on).
- The V_{CAP} value specified in this data sheet includes a minimum and a maximum value size. The best practice is to meet this requirement and not exceed the maximum V_{CAP} value because the higher inrush currents may reduce the reliability of the internal pass transistor. Customers who want to use a larger V_{CAP} value to make sure there is extra store charge should discuss their V_{CAP} size selection with Cypress.

Not Recommended for New Designs, in production to support ongoing production customers only

Table 2. Hardware Mode Selection

$\overline{CE}$	$\overline{WE}$	$\overline{HSB}$	A10–A0	Mode	I/O	Power
H	X	H	X	Not selected	Output high Z	Standby
L	H	H	X	Read SRAM	Output data	Active[1]
L	L	H	X	Write SRAM	Input data	Active
X	X	L	X	Nonvolatile STORE	Output high Z	I_{CC2}[2]

Notes
1. I/O state assumes $\overline{OE} \le V_{IL}$. Activation of nonvolatile cycles does not depend on state of $\overline{OE}$.
2. $\overline{HSB}$ STORE operation occurs only if an SRAM Write is done since the last nonvolatile cycle. After the STORE (If any) completes, the part goes into standby mode, inhibiting all operations until HSB rises.

Not Recommended for New Designs.
In production to support ongoing production programs only.

© Cypress Semiconductor Corporation, 2006-2011. The information contained herein is subject to change without notice. Cypress Semiconductor Corporation assumes no responsibility for the use of any circuitry other than circuitry embodied in a Cypress product. Nor does it convey or imply any license under patent or other rights. Cypress products are not warranted nor intended to be used for medical, life support, life saving, critical control or safety applications, unless pursuant to an express written agreement with Cypress. Furthermore, Cypress does not authorize its products for use as critical components in life-support systems where a malfunction or failure may reasonably be expected to result in significant injury to the user. The inclusion of Cypress products in life-support systems application implies that the manufacturer assumes all risk of such use and in doing so indemnifies Cypress against all charges.

Any Source Code (software and/or firmware) is owned by Cypress Semiconductor Corporation (Cypress) and is protected by and subject to worldwide patent protection (United States and foreign), United States copyright laws and international treaty provisions. Cypress hereby grants to licensee a personal, non-exclusive, non-transferable license to copy, use, modify, create derivative works of, and compile the Cypress Source Code and derivative works for the sole purpose of creating custom software and or firmware in support of licensee product to be used only in conjunction with a Cypress integrated circuit as specified in the applicable agreement. Any reproduction, modification, translation, compilation, or representation of this Source Code except as specified above is prohibited without the express written permission of Cypress.

Disclaimer: CYPRESS MAKES NO WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, WITH REGARD TO THIS MATERIAL, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. Cypress reserves the right to make changes without further notice to the materials described herein. Cypress does not assume any liability arising out of the application or use of any product or circuit described herein. Cypress does not authorize its products for use as critical components in life-support systems where a malfunction or failure may reasonably be expected to result in significant injury to the user. The inclusion of Cypress' product in a life-support systems application implies that the manufacturer assumes all risk of such use and in doing so indemnifies Cypress against all charges.

Use may be limited by and subject to the applicable Cypress software license agreement.
