CY7C4261, CY7C4271

16 K/32 K × 9 Deep Sync FIFOs

Features

- High speed, low power, first-in first-out (FIFO) memories
- 16 K × 9 (CY7C4261)
- 32 K × 9 (CY7C4271)
- 0.5 micron CMOS for optimum speed and power
- High speed 100 MHz operation (10 ns read/write cycle times)
- Low power — I_{CC} = 35 mA
- Fully asynchronous and simultaneous read and write operation
- Empty, full, half full, and programmable almost empty and almost full status flags
- TTL compatible
- Output enable ($\overline{OE}$) pins
- Independent read and write enable pins
- Center power and ground pins for reduced noise
- Supports free running 50% duty cycle clock inputs
- Width expansion capability
- 32-pin PLCC and 32-pin TQFP
- Pin compatible density upgrade to CY7C42X1 family
- Pin compatible density upgrade to IDT72201/11/21/31/41/51
- Pb-free packages available

Functional Description

The CY7C4261/71 are high speed, low power FIFO memories with clocked read and write interfaces. All are nine bits wide. The CY7C4261/71 are pin compatible to the CY7C42X1 synchronous FIFO family. The CY7C4261/71 can be cascaded to increase FIFO width. Programmable features include almost full/almost empty flags. These FIFOs provide solutions for a wide variety of data buffering needs, including high speed data acquisition, multiprocessor interfaces, and communications buffering.

These FIFOs have 9-bit input and output ports that are controlled by separate clock and enable signals. The input port is controlled by a free-running clock (WCLK) and two write-enable pins ($\overline{WEN1}$, WEN2/$\overline{LD}$).

When $\overline{WEN1}$ is LOW and WEN2/$\overline{LD}$ is HIGH, data is written into the FIFO on the rising edge of the WCLK signal. While $\overline{WEN1}$, WEN2/$\overline{LD}$ is held active, data is continually written into the FIFO on each WCLK cycle. The output port is controlled in a similar manner by a free running read clock (RCLK) and two read enable pins ($\overline{REN1}$, $\overline{REN2}$). In addition, the CY7C4261/71 has an output enable pin ($\overline{OE}$). The read (RCLK) and write (WCLK) clocks may be tied together for single-clock operation or the two clocks may be run independently for asynchronous read/write applications. Clock frequencies up to 100 MHz are achievable. Depth expansion is possible using one enable input for system control, while the other enable is controlled by expansion logic to direct the flow of data.

Table 1. Pin Definitions - 32-pin Device

Signal Name	Description	IO	Description
D_{0-8}	Data inputs	I	Data inputs for 9-bit bus.
Q_{0-8}	Data outputs	O	Data outputs for 9-bit bus.
$\overline{WEN1}$	Write enable 1	I	The only write enable when device is configured to have programmable flags. Data is written on a LOW-to-HIGH transition of WCLK when $\overline{WEN1}$ is asserted and $\overline{FF}$ is HIGH. If the FIFO is configured to have two write enables, data is written on a LOW-to-HIGH transition of WCLK when $\overline{WEN1}$ is LOW and WEN2/$\overline{LD}$ and $\overline{FF}$ are HIGH.
WEN2/$\overline{LD}$ Dual Mode Pin	Write enable 2 Load	I	If HIGH at reset, this pin operates as a second write enable. If LOW at reset, this pin operates as a control to write or read the programmable flag offsets. $\overline{WEN1}$ must be LOW and WEN2 must be HIGH to write data into the FIFO. Data is not written into the FIFO if the $\overline{FF}$ is LOW. If the FIFO is configured to have programmable flags, WEN2/$\overline{LD}$ is held LOW to write or read the programmable flag offsets.
$\overline{REN1}$, $\overline{REN2}$	Read enable inputs	I	Enables the device for read operation. Both $\overline{REN1}$ and $\overline{REN2}$ must be asserted to allow a read operation.
WCLK	Write clock	I	The rising edge clocks data into the FIFO when $\overline{WEN1}$ is LOW and WEN2/$\overline{LD}$ is HIGH and the FIFO is not full. When $\overline{LD}$ is asserted, WCLK writes data into the programmable flag-offset register.
RCLK	Read clock	I	The rising edge clocks data out of the FIFO when $\overline{REN1}$ and $\overline{REN2}$ are LOW and the FIFO is not empty. When WEN2/$\overline{LD}$ is LOW, RCLK reads data out of the programmable flag-offset register.
$\overline{EF}$	Empty flag	O	When $\overline{EF}$ is LOW, the FIFO is empty. $\overline{EF}$ is synchronized to RCLK.
$\overline{FF}$	Full flag	O	When $\overline{FF}$ is LOW, the FIFO is full. $\overline{FF}$ is synchronized to WCLK.
$\overline{PAE}$	Programmable almost empty	O	When $\overline{PAE}$ is LOW, the FIFO is almost empty based on the almost empty offset value programmed into the FIFO. $\overline{PAE}$ is synchronized to RCLK.
$\overline{PAF}$	Programmable almost full	O	When $\overline{PAF}$ is LOW, the FIFO is almost full based on the almost full offset value programmed into the FIFO. $\overline{PAF}$ is synchronized to WCLK.
$\overline{RS}$	Reset	I	Resets device to empty condition. A reset is required before an initial read or write operation after power-up.
$\overline{OE}$	Output enable	I	When $\overline{OE}$ is LOW, the FIFO's data outputs drive the bus to which they are connected. If $\overline{OE}$ is HIGH, the FIFO's outputs are in high Z (high impedance) state.

Functional Description

The CY7C4261/71 provides four status pins: empty, full, programmable almost empty, and programmable almost full. The almost empty/almost full flags are programmable to single word granularity. The programmable flags default to empty + 7 and full – 7.

The flags are synchronous, that is, they change state relative to either the read clock (RCLK) or the write clock (WCLK). When entering or exiting the empty and almost empty states, the flags are updated exclusively by the RCLK. The flags denoting almost full, and full states are updated exclusively by WCLK. The synchronous flag architecture guarantees that the flags maintain their status for at least one cycle.

All configurations are fabricated using an advanced 0.5 µ CMOS technology. Input ESD protection is greater than 2001 V, and latch-up is prevented by the use of guard rings.

Architecture

The CY7C4261/71 consists of an array of 16 K to 32 K words of nine bits each (implemented by a dual port array of SRAM cells), a read pointer, a write pointer, control signals (RCLK, WCLK, REN1, REN2, WEN1, WEN2, $\overline{RS}$), and flags ($\overline{EF}$, $\overline{PAE}$, $\overline{PAF}$, $\overline{FF}$).

Resetting the FIFO

Upon power up, the FIFO must be reset with a reset ($\overline{RS}$) cycle. This causes the FIFO to enter the empty condition signified by $\overline{EF}$ being LOW. All data outputs (Q_{0-8}) go LOW t_{RSF} after the rising edge of $\overline{RS}$. For the FIFO to reset to its default state, a falling edge must occur on $\overline{RS}$ and the user must not read or write while $\overline{RS}$ is LOW. All flags are guaranteed to be valid t_{RSF} after $\overline{RS}$ is taken LOW.

FIFO Operation

When the $\overline{WEN1}$ signal is active LOW, WEN2 is active HIGH, and $\overline{FF}$ is active HIGH, data present on the D_{0-8} pins is written into the FIFO on each rising edge of the WCLK signal. Similarly, when the $\overline{REN1}$ and $\overline{REN2}$ signals are active LOW and $\overline{EF}$ is active HIGH, data in the FIFO memory is presented on the Q_{0-8} outputs. New data is presented on each rising edge of RCLK while $\overline{REN1}$ and $\overline{REN2}$ are active. $\overline{REN1}$ and $\overline{REN2}$ must set up t_{ENS} before RCLK for it to be a valid read function. $\overline{WEN1}$ and WEN2 must occur t_{ENS} before WCLK for it to be a valid write function.

An output enable ($\overline{OE}$) pin is provided to three-state the Q_{0-8} outputs when $\overline{OE}$ is asserted. When $\overline{OE}$ is enabled (LOW), data in the output register is available to the Q_{0-8} outputs after t_{OE}. If devices are cascaded, the $\overline{OE}$ function only outputs data on the FIFO that is read enabled.

The FIFO contains overflow circuitry to disallow additional writes when the FIFO is full, and underflow circuitry to disallow additional reads when the FIFO is empty. An empty FIFO maintains the data of the last valid read on its Q_{0-8} outputs even after additional reads occur.

Write enable 1 ($\overline{WEN1}$). If the FIFO is configured for programmable flags, write enable 1 ($\overline{WEN1}$) is the only write enable control pin. In this configuration, when write enable 1 ($\overline{WEN1}$) is LOW, data can be loaded into the input register and RAM array on the LOW-to-HIGH transition of every write clock (WCLK). Data is stored is the RAM array sequentially and independently of any on-going read operation.

Write enable 2/load (WEN2/$\overline{LD}$). This is a dual purpose pin. The FIFO is configured at reset to have programmable flags or to have two write enables, which allows for depth expansion. If write enable 2/load (WEN2/$\overline{LD}$) is set active HIGH at reset ($\overline{RS}$ = LOW), this pin operates as a second write enable pin.

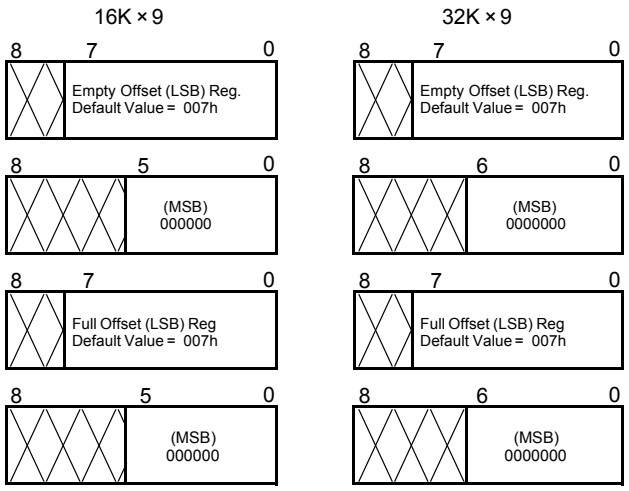
If the FIFO is configured to have two write enables, when write enable ($\overline{WEN1}$) is LOW and write enable 2/load (WEN2/$\overline{LD}$) is HIGH, data can be loaded into the input register and RAM array on the LOW-to-HIGH transition of every write clock (WCLK). Data is stored in the RAM array sequentially and independently of any ongoing read operation.

Programming

When WEN2/$\overline{LD}$ is held LOW during reset, this pin is the load ($\overline{LD}$) enable for flag offset programming. In this configuration, WEN2/$\overline{LD}$ can be used to access the four 8-bit offset registers contained in the CY7C4261/71 for writing or reading data to these registers.

When the device is configured for programmable flags and both WEN2/$\overline{LD}$ and $\overline{WEN1}$ are LOW, the first LOW-to-HIGH transition of WCLK writes data from the data inputs to the empty offset least significant bit (LSB) register. The second, third, and fourth LOW-to-HIGH transitions of WCLK store data in the empty offset most significant bit (MSB) register, full offset LSB register, and full offset MSB register, respectively, when WEN2/$\overline{LD}$ and $\overline{WEN1}$ are LOW. The fifth LOW-to-HIGH transition of WCLK while WEN2/$\overline{LD}$ and $\overline{WEN1}$ are LOW writes data to the empty LSB register again. Figure 3 shows the register sizes and default values for the various device types.

Figure 3. Offset Register Location and Default Values



It is not necessary to write to all the offset registers at one time. A subset of the offset registers can be written, and then by bringing the WEN2/LD input HIGH, the FIFO is returned to normal read and write operation. The next time WEN2/LD is brought LOW, a write operation stores data in the next offset register in sequence.

The contents of the offset registers can be read to the data outputs when WEN2/LD is LOW and both REN1 and REN2 are LOW. LOW-to-HIGH transitions of RCLK read register contents to the data outputs. Writes and reads must not be performed simultaneously on the offset registers.

Programmable Flag ($\overline{PAE}$, $\overline{PAF}$) Operation

Whether the flag offset registers are programmed as described in Table 2 or the default values are used, the programmable almost-empty flag ($\overline{PAE}$) ($\overline{PAF}$) states are determined by their corresponding offset registers and the difference between the read and write pointers.

Table 2. Writing the Offset Registers

$\overline{LD}$	$\overline{WEN}$	WCLK[1]	Selection
0	0		Empty offset (LSB) Empty offset (MSB) Full offset (LSB) Full offset (MSB) 0	1		No operation
1	0		Write Into FIFO
1	1		No operation

The number formed by the empty offset least significant bit register and empty offset most significant bit register is referred to as *n* and determines the operation of $\overline{PAE}$. $\overline{PAE}$ is synchronized to the LOW-to-HIGH transition of RCLK by one flip-flop and is LOW when the FIFO contains n or fewer unread words. $\overline{PAE}$ is set HIGH by the LOW-to-HIGH transition of RCLK when the FIFO contains (n+1) or greater unread words.

The number formed by the full offset least significant bit register and full offset most significant bit register is referred to as *m* and determines the operation of $\overline{PAF}$. $\overline{PAF}$ is synchronized to the LOW-to-HIGH transition of WCLK by one flip-flop and is set LOW when the number of unread words in the FIFO is greater than or equal to CY7C4261 (16K-m) and CY7C4271 (32K-m). $\overline{PAF}$ is set HIGH by the LOW-to-HIGH transition of WCLK when the number of available memory locations is greater than m.

Table 3. Status Flags

Number of Words in FIFO		$\overline{FF}$	$\overline{PAF}$	$\overline{PAE}$	$\overline{EF}$
CY7C4261	CY7C4271				
0	0	H	H	L	L
1 to n[2]	1 to n[2]	H	H	L	H
(n + 1) to (16384 – (m + 1))	(n + 1) to (32768 – (m + 1))	H	H	H	H
(16384 – m)[3] to 16383	(32768 – m)[3] to 32767	H	L	H	H
16384	32768	L	L	H	H

Width Expansion Configuration

Word width may be increased by simply connecting the corresponding input controls signals of multiple devices. A composite flag must be created for each of the end-point status flags ($\overline{EF}$ and $\overline{FF}$). The partial status flags ($\overline{PAE}$ and $\overline{PAF}$) can be detected from any one device. Figure 4 on page 7 demonstrates a 18-bit word width by using two CY7C4261/71s. Any word width can be attained by adding additional CY7C4261/71s.

When the CY7C4261/71 is in a width expansion configuration, the read enable ($\overline{REN2}$) control input can be grounded (see Figure 4 on page 7). In this configuration, the write enable 2/load (WEN2/LD) pin is set to LOW at reset so that the pin operates as a control to load and read the programmable flag offsets.

Flag Operation

The CY7C4261/71 devices provide four flag pins to indicate the condition of the FIFO contents. Empty, Full, $\overline{PAE}$, and $\overline{PAF}$ are synchronous.

Full Flag

The full flag ($\overline{FF}$) goes LOW when the device is full. Write operations are inhibited whenever $\overline{FF}$ is LOW regardless of the state of $\overline{WEN1}$ and WEN2/LD. $\overline{FF}$ is synchronized to WCLK, that is, it is exclusively updated by each rising edge of WCLK.

Empty Flag

The empty flag ($\overline{EF}$) goes LOW when the device is empty. Read operations are inhibited whenever $\overline{EF}$ is LOW, regardless of the state of $\overline{REN1}$ and $\overline{REN2}$. $\overline{EF}$ is synchronized to RCLK, that is, it is exclusively updated by each rising edge of RCLK.

Notes
1. The same selection sequence applies to reading from the registers. $\overline{REN1}$ and $\overline{REN2}$ are enabled and a read is performed on the LOW-to-HIGH transition of RCLK.
2. n = Empty offset (n = 7 default value).
3. m = Full offset (m = 7 default value).

Maximum Ratings

Exceeding maximum ratings[4] may impair the useful life of the device. These user guidelines are not tested.

Storage temperature ..... –65 °C to +150 °C

Ambient temperature with power applied..... –55 °C to +125 °C

Supply voltage to ground potential ..... –0.5 V to +7.0 V

DC voltage applied to outputs in high Z State ..... –0.5 V to V_{CC} + 0.5 V

DC input voltage ..... –0.5 V to V_{CC} + 0.5 V

Output current into outputs (LOW) ..... 20 mA

Static discharge voltage..... > 2001 V

Latch-up current ..... > 200 mA

Operating Range

Range	Ambient Temperature	V_{CC}
Commercial	0 °C to +70 °C	5 V ± 10%
Industrial[5]	–40 °C to +85 °C	5 V ± 10%

Electrical Characteristics

Over the Operating Range

Parameter	Description	Test Conditions		7C4261/71-10		7C4261/71-15		Unit
				Min	Max	Min	Max	
V_{OH}	Output HIGH voltage	V_{CC} = Min, I_{OH} = –2.0 mA		2.4	–	2.4	–	V
V_{OL}	Output LOW voltage	V_{CC} = Min, I_{OL} = 8.0 mA		–	0.4	–	0.4	V
V_{IH}	Input HIGH voltage (Commercial/Industrial)			2.0	V_{CC}	2.0	V_{CC}	V
V_{IH}	Input HIGH voltage (Military)			2.2	V_{CC}	2.2	V_{CC}	V
V_{IL}	Input LOW voltage			–0.5	0.8	–0.5	0.8	V
I_{IX}	Input leakage current	V_{CC} = Max		–10	+10	–10	+10	µA
I_{OZL} I_{OZH}	Output OFF, high Z current	$\overline{OE} \geq V_{IH}$, $V_{SS} < V_O < V_{CC}$		–10	+10	–10	+10	µA
I_{CC1}[6]	Active power supply current		Commercial	–	35	–	35	mA
			Industrial	–	40	–	40	mA
I_{SB}[7]	Average standby current		Commercial	–	10	–	10	mA
			Industrial	–	15	–	15	mA

Capacitance

Parameter[8]	Description	Test Conditions	Max	Unit
C_{IN}	Input capacitance	T_A = 25 °C, f = 1 MHz, V_{CC} = 5.0 V	5	pF
C_{OUT}	Output capacitance		7	pF

Notes

4. The voltage on any input or IO pin cannot exceed the power pin during power-up.
5. TA is the “instant on” case temperature.
6. Input signals switch from 0 V to 3 V with a rise/fall time of less than 3 ns, clocks and clock enables switch at maximum frequency 20 MHz, while data inputs switch at 10 MHz. Outputs are unloaded. I_{CC1}(typical) = (20 mA + (freq – 20 MHz) × (0.7 mA/MHz)).
7. All inputs = V_{CC} – 0.2 V, except WCLK and RCLK (which are switching at frequency = 20 MHz). All outputs are unloaded.
8. Tested initially and after any design or process changes that may affect these parameters.

Figure 5. AC Test Loads and Waveforms [10, 11]

t_{SKEW2}	Skew time between read clock and write clock for almost empty flag and almost full flag	10	–	15	–	ns

Notes
10. 5CL = 30 pF for all AC parameters except for t_{OHZ}.
11. 5CL = 5 pF for t_{OHZ}.
12. Pulse widths less than minimum values are not allowed.
13. Values guaranteed by design, not currently tested.

Switching Waveforms

Figure 6. Write Cycle Timing

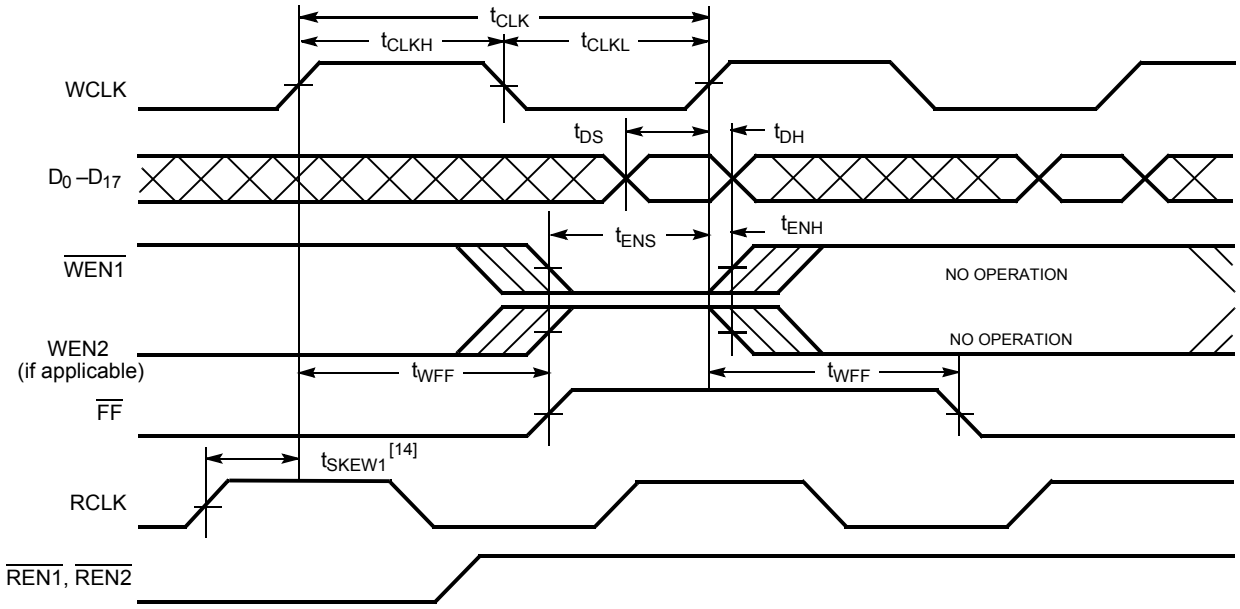

Figure 7. Read Cycle Timing

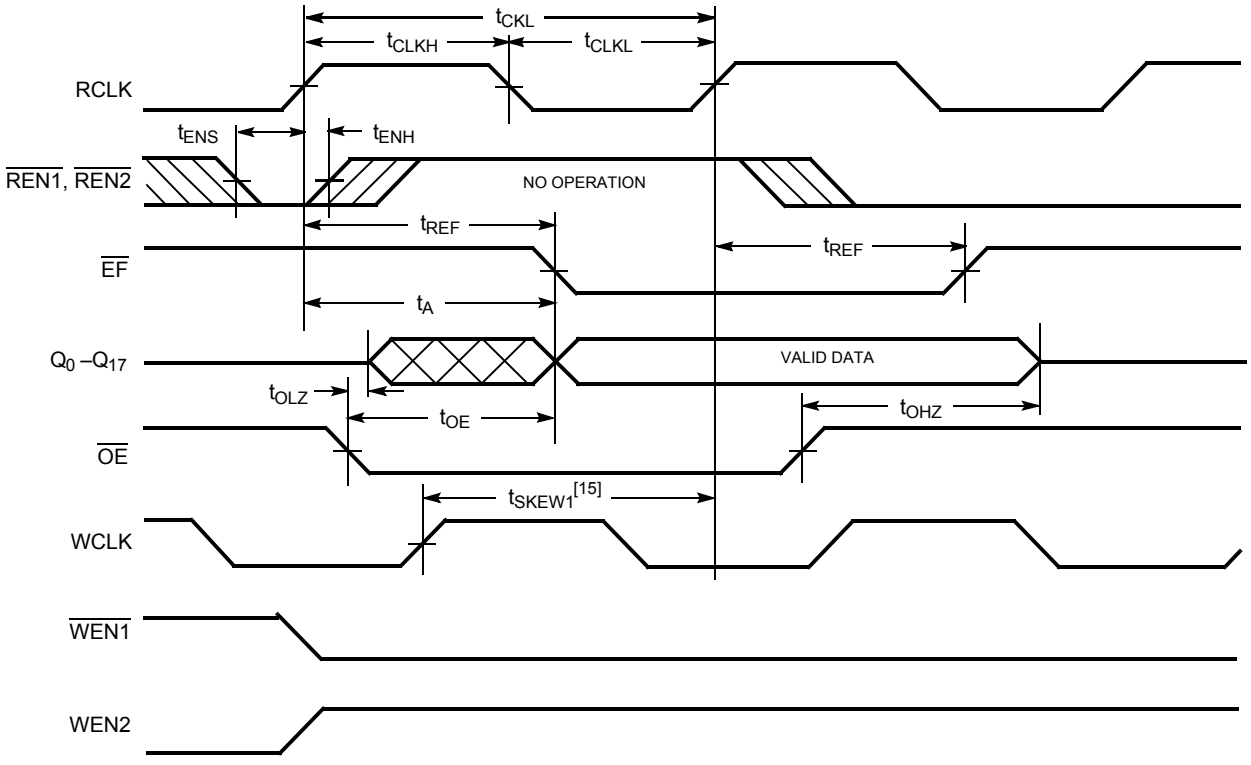

Notes

14. t_{SKEW1} is the minimum time between a rising RCLK edge and a rising WCLK edge to guarantee that $\overline{FF}$ goes HIGH during the current clock cycle. If the time between the rising edge of RCLK and the rising edge of WCLK is less than t_{SKEW1}, then $\overline{FF}$ may not change state until the next WCLK rising edge.
15. t_{SKEW1} is the minimum time between a rising WCLK edge and a rising RCLK edge to guarantee that $\overline{EF}$ goes HIGH during the current clock cycle. It the time between the rising edge of WCLK and the rising edge of RCLK is less than t_{SKEW2}, then $\overline{EF}$ may not change state until the next RCLK rising edge.

Switching Waveforms *(continued)*

Figure 8. Reset Timing [16]

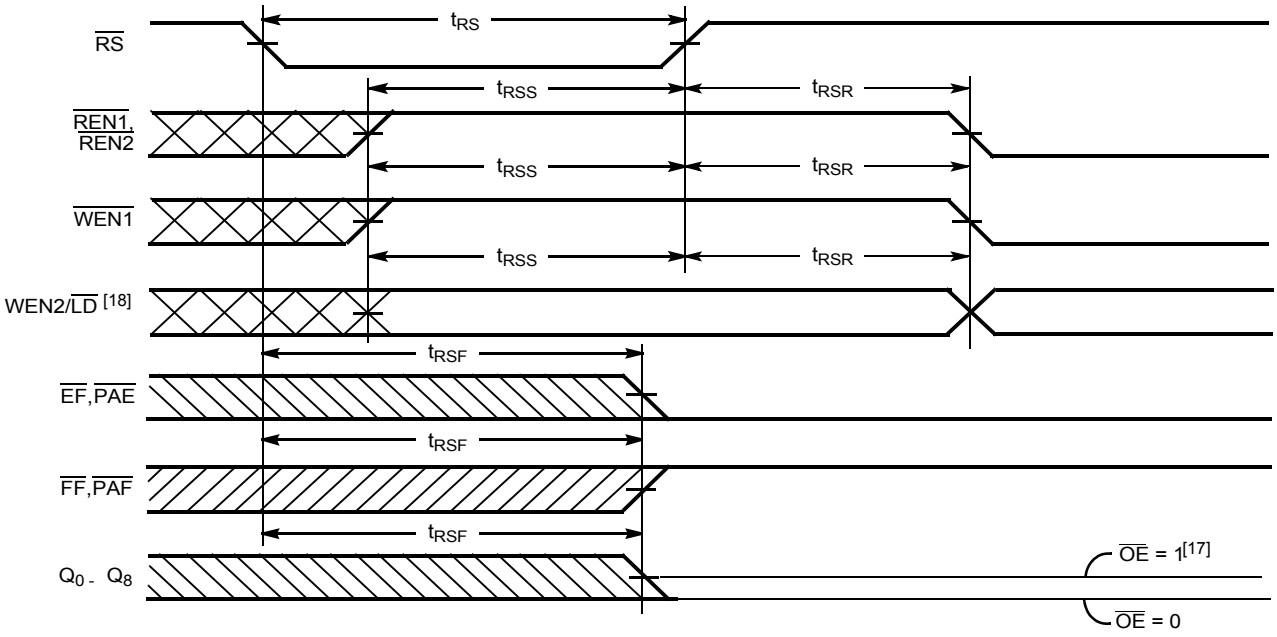

Figure 9. First Data Word Latency after Reset with Read and Write

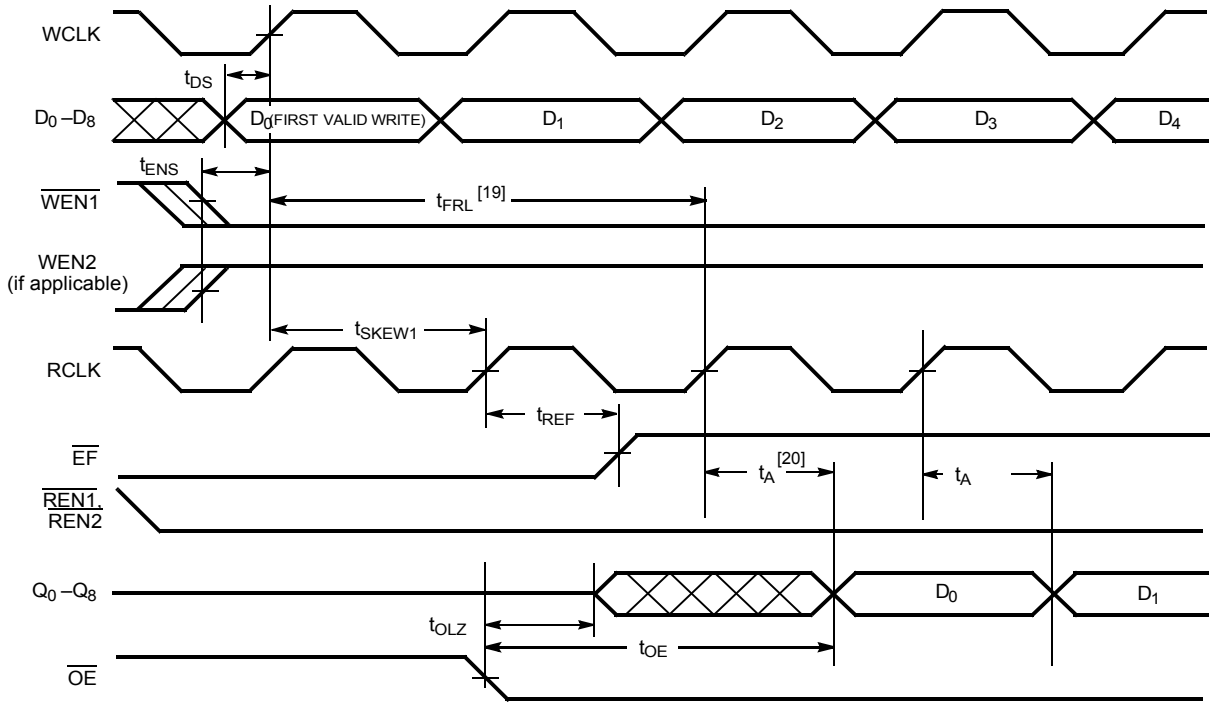

Notes

16. The clocks (RCLK, WCLK) can be free running during reset.
17. After reset, the outputs are LOW if $\overline{OE}$ = 0 and three-state if $\overline{OE}$ = 1.
18. Holding WEN2/$\overline{LD}$ HIGH during reset makes the pin act as a second enable pin. Holding WEN2/$\overline{LD}$ LOW during reset makes the pin act as a load enable for the programmable flag offset registers.
19. When $t_{SKEW1} \geq$ minimum specification, t_{FRL} (maximum) = $t_{CLK} + t_{SKEW2}$. When t_{SKEW2} < minimum specification, t_{FRL} (maximum) = either $2 \times t_{CLK} + t_{SKEW1}$ or $t_{CLK} + t_{SKEW1}$. The Latency Timing applies only at the Empty Boundary ($\overline{EF}$ = LOW).
20. The first word is available the cycle after $\overline{EF}$ goes HIGH, always.

Switching Waveforms *(continued)*

Figure 10. Empty Flag Timing

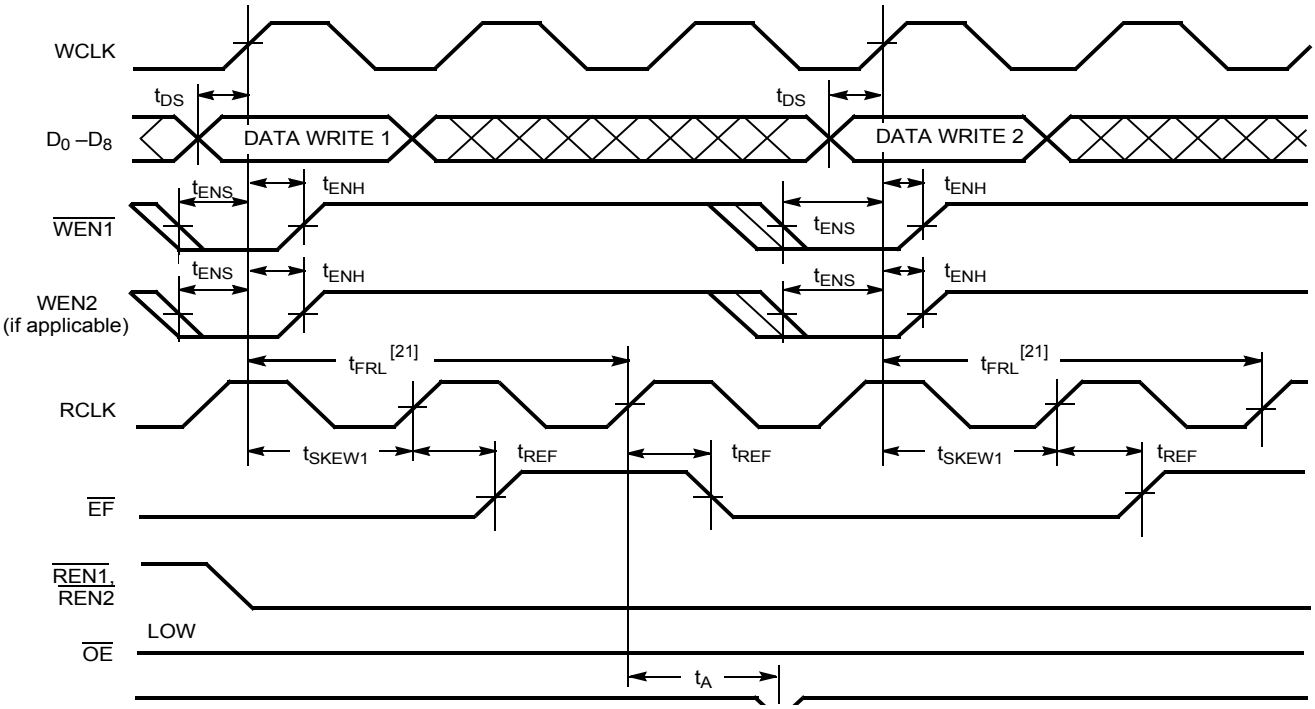

Figure 11. Full Flag Timing

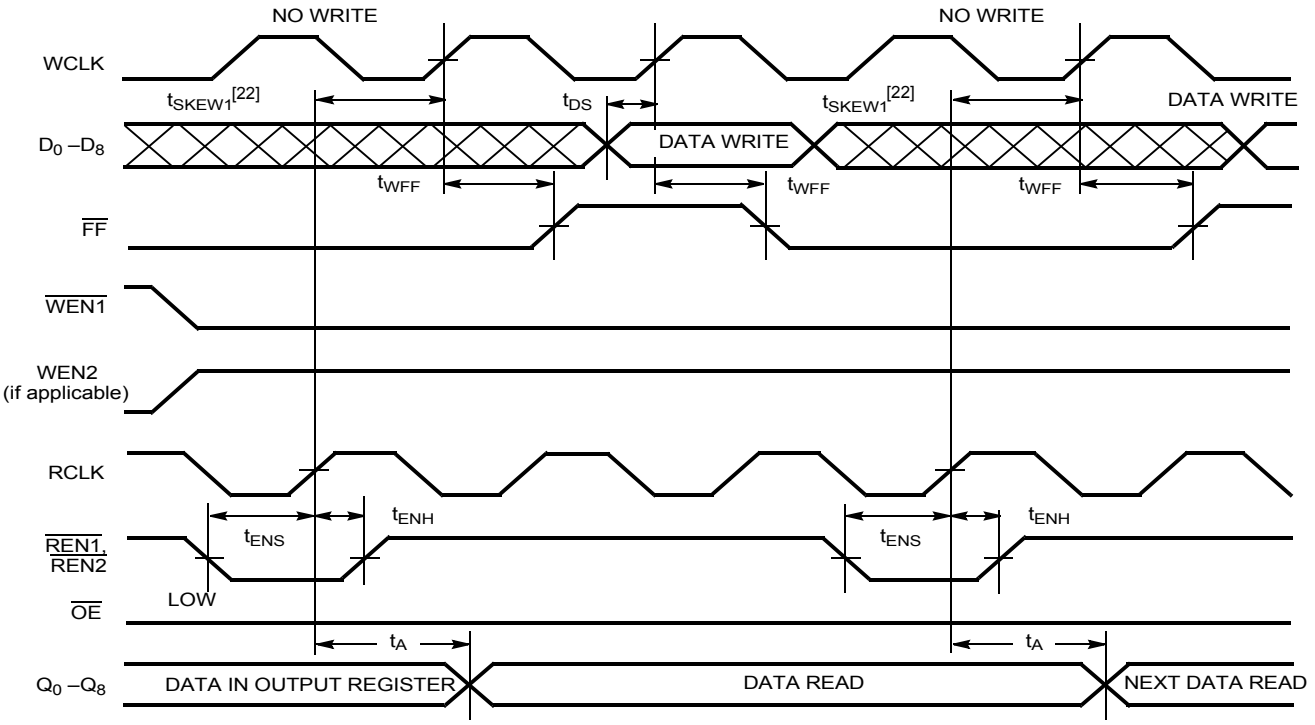

Notes

21. When $t_{SKEW1} \geq$ minimum specification, t_{FRL} (maximum) = $t_{CLK} + t_{SKEW2}$. When t_{SKEW2} < minimum specification, t_{FRL} (maximum) = either $2 \times t_{CLK} + t_{SKEW1}$ or $t_{CLK} + t_{SKEW1}$. The Latency Timing applies only at the Empty Boundary ($\overline{EF}$ = LOW).
22. t_{SKEW1} is the minimum time between a rising RCLK edge and a rising WCLK edge to guarantee that $\overline{FF}$ goes HIGH during the current clock cycle. If the time between the rising edge of RCLK and the rising edge of WCLK is less than t_{SKEW1}, then $\overline{FF}$ may not change state until the next WCLK rising edge.

Switching Waveforms *(continued)*

Figure 12. Programmable Almost Empty Flag Timing

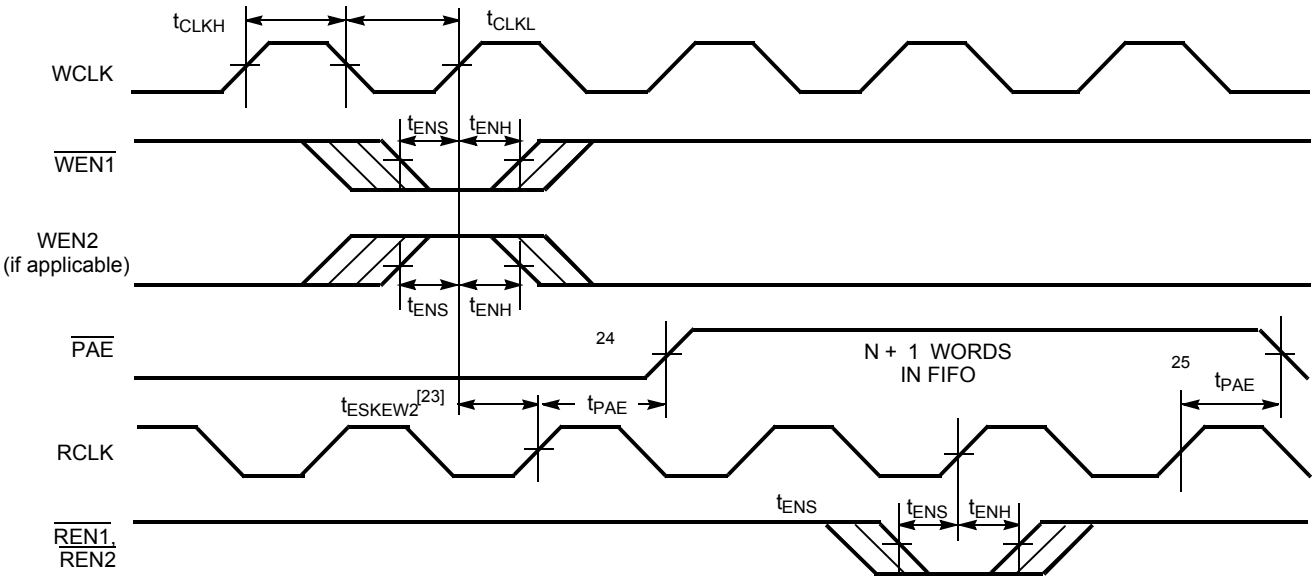

Figure 13. Programmable Almost Full Flag Timing

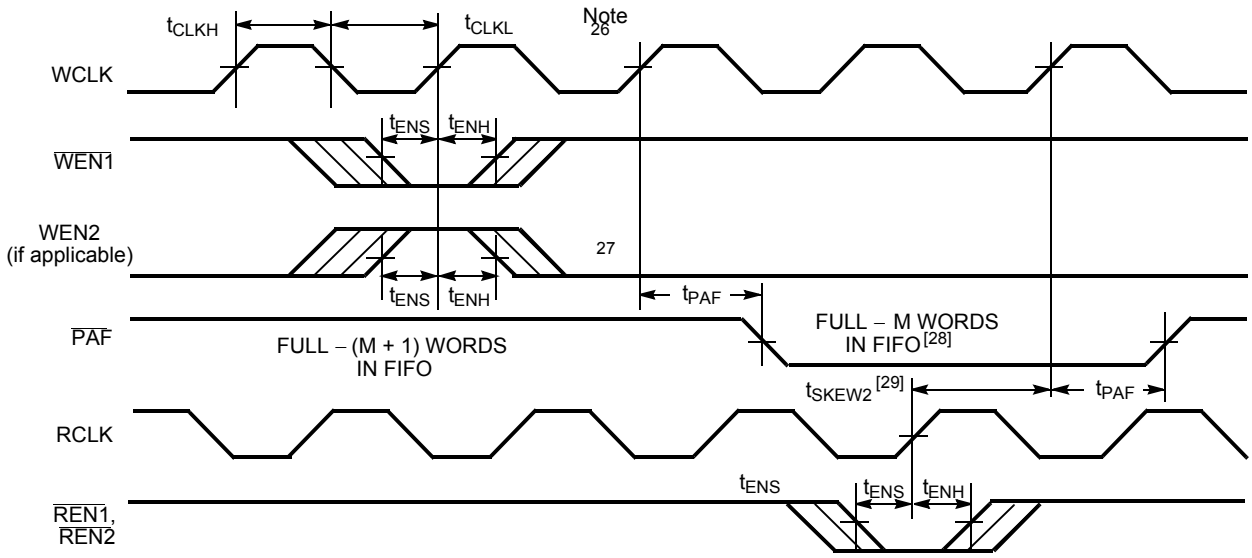

Notes

23. t_{SKEW2} is the minimum time between a rising WCLK and a rising RCLK edge for $\overline{PAE}$ to change state during that clock cycle. If the time between the edge of WCLK and the rising RCLK is less than t_{SKEW2}, then $\overline{PAE}$ may not change state until the next RCLK.
24. PAE offset = n.
25. If a read is preformed on this rising edge of the read clock, there are Empty + (n–1) words in the FIFO when $\overline{PAE}$ goes LOW
26. If a write is performed on this rising edge of the write clock, there are Full – (m–1) words of the FIFO when $\overline{PAF}$ goes LOW.
27. PAF offset = m.
28. 16,384 – m words for CY7C4261, 32,768 – m words for CY7C4271.
29. t_{SKEW2} is the minimum time between a rising RCLK edge and a rising WCLK edge for $\overline{PAF}$ to change during that clock cycle. If the time between the rising edge of RCLK and the rising edge of WCLK is less than t_{SKEW2}, then $\overline{PAF}$ may not change state until the next WCLK.
