

## ezyLED 24V DC 3030 EMC AB-EZD Series

ezyLED reduces driving circuit dramatically. All ezyLEDs are connected in parallel, and directly driven by a conventional 24V DC voltage source without the needs of the driver IC and passive components. With ezyLED so easy to use, users only have to focus on the design of the lamps. Inventory management of components is minimized.

AB-EZD products operate over a wide voltage range (Figure 3). Luminous intensity remains constant for  $22.5V < V_{in} < 36V$ , and maintains approximately 50% of its nominal value when input voltage drops to 21.5 volts.

AB-EZD products support over temperature protection (OTP) by reducing input current and hence the luminous intensity when the device temperature exceeds  $120^{\circ}C$  (Figure 2). For long-term reliability, sufficient heat dissipation mechanism in lamp design is required to ensure ezyLED operates in the rated temperature range ( $-40^{\circ}C \sim 85^{\circ}C$ ).

## Features
