Surface Mount Oven Stabilized Oscillator DOC Series

OCXO / VCOCXO

Description:

Connor-Winfield's high stability DOC series are

exceptionally precise frequency standards, excellent for use in cellular base stations, test equipment, Synchronous Ethernet and VSAT applications. These true surface mount

OCXO / VCOCXO oscillators provide frequency stabilities in the range of ±20 ppb to ±250ppb, over the commercial, extended commercial or the industrial temperature range.

The DOC series is available with a CMOS output and a Voltage Controlled Option. These oscillators provide outstanding phase noise characteristics that will meet the most stringent requirements.

Features:

- OCXO Fixed Frequency VCOCXO - Voltage Controlled Option
- 3.3 Vdc Operation
- SMT Package
- Frequency Stabilities Available: ±20ppb, ±50ppb, ±100ppb, ±140ppb, ±250ppb

Suggested Pad Layout

- Temperature Ranges Available: 0 to 70°C, -20 to 75°, -40 to 85°C or -40 to 70°C
- Low Phase Noise
- LVCMOS Output
- Optional Electronic Frequency Tuning
- RoHS Compliant / Lead Free

Package Outline

Attention: System Designers please review Application Note AN2093: System Design Information and Printed Circuit Board Layout Guidelines for OCXO Oscillators. www.conwin.com/support.html

Pad Connections

- 1: N/C or Voltage Control (Vc)
- 2: Do Not Connect*
- 3: Ground
- Output
- 5: Do Not Connect*
- 6: Supply Voltage (Vcc)

*DO NOT connect "DNC" pads to ground or supply rails.

Package Characteristics

DOC Package Package consisting of a FR-4 substrate and Ryton-R-4 cover. Water Resistant package, non-hermetic seal. (Engineering Properties of Ryton R-4 Application Note AN2100)

Environmental Characteristics

Shock	500 G's 1ms, Halfsine, 3 shocks per direction, per MIL-STD 202G, Method 213B Test Condition D.	
Sinusoidal Vibration	0.06" D.A. or 10G's Peak, 10 to 500 Hz, per MIL-STD-202G, Method 204D, Test Condition A.	
Random Vibration	5.35 G's rms. 20 to 2000 Hz per MIL-STD-202G, Method 214, Test Condition 1A, 15 minutes each axis.	
Moisture	10 cycles, 95% RH, Per MIL-STD-202G, Method 112.	
Marking Permanency	Per MIL-STD-202G, Method 215J.	
Solder Process Recommendations:	RoHS compliant, lead free. See solder profile on page 4.	
In-line oven profile:	We recommend using KIC profiler or similar device placing one of the thermocouples on the	
•	device to insure that the package temperature does not exceed 235°C for more than 20 seconds.	

device to insure that the package temperature does not exceed 235°C for more than 20 seconds. If for any reason the device needs to be removed from the board, use a temperature controlled repair station with profile monitoring capabilities. Following a monitored profile will insure the device is properly pre-heated prior to reflow. Refer to IPC 610E for inspection guidelines.

Recommended Cleaning Process: (If required)

Device is non-hermetic, water resistance with four weep holes, one in each corner to allow moisture to be removed during the drying cycle. We recommend in-line warm water wash with air knife and drying capabilities. If cleaner does not have drying capability, then use hot air circulated oven. Boards should be placed in the oven vertically for good water runoff

Device must be dried properly prior to use!

Note: If saponifier is used make sure the device is rinsed properly to insure all residues are removed. PH of saponifier should

not exceed 10.

Removal of device:

Drying Temperature: Between 85 to 100°C.

Drying Time: Time will vary depending on the board size.

Caution: Do not submerge the device!

Notes:

- 1. Frequency stability vs. change in temperature. [±(Fmax Fmin)/(2*Fo)].
- 2. Initial calibration @ 25°C. For OCXO with EFT, the control voltage must be fixed.
- 3. After 30 days of operation.
- 4. Inclusive of calibration @ 25°C, frequency vs. change in temperature, change in supply voltage (±5%), load change (±5%), shock and vibration and 20 years aging.
- 5. Minimum "Power On Time" after rail rises from 0 to within ±5% of Vcc = 1 second. Supply voltage must reach Vcc level monotonically.
- 6. 10ms start time is guaranteed when supply voltage reaches Vcc level in <= 500us. If supply ramp is greater than 500us, then start times as long as 1s are possible.
- 7. Attention: To achieve optimal frequency stability, and in some cases to meet the specification stated on this data sheet, it is required that the circuit connected to this OCXO output must have the equivalent input capacitance that is specified by the nominal load capacitance. Loads higher than the nominal value will have a graduated effect on the stability of approximately 20ppb per pf of load difference.
- 8. Positive slope (frequency increases as Vc voltage increases). To ensure proper operation of VCOCXO's, the control voltage input must be biased to the nominal control voltage. Failure to bias the Vc input may result in an unstable output condition.
- 9. Referenced to Fo.
