$I_D$	<b>Continuous currents</b> Drain current	$V_{PS} = 5 \text{ V}; T_{mb} = 25^\circ\text{C}$ $V_{PS} = 0 \text{ V}; T_{mb} = 85^\circ\text{C}$	-	self - limited 30	A A

$I_F$	Flag current		-5	5	mA
$I_P$	Protection supply current		-5	5	mA
$P_{tot}$	<b>Thermal</b> Total power dissipation	$T_{mb} = 25^\circ\text{C}$	-	90	W
$T_{stg}$	Storage temperature		-55	175	$^\circ\text{C}$
$T_J$	Junction temperature <sup>2</sup>	continuous	-	150	$^\circ\text{C}$
$T_{sold}$	Mounting base temperature	during soldering	-	260	$^\circ\text{C}$

**ESD LIMITING VALUE**

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
$V_C$	Electrostatic discharge capacitor voltage	Human body model; $C = 250 \text{ pF}; R = 1.5 \text{ k}\Omega$	-	2	kV

**OVERLOAD PROTECTION LIMITING VALUE**

With an adequate protection supply connected, TOPFET can protect itself from two types of overload - overtemperature and short circuit load.

For overload conditions an n-MOS transistor turns on between the input and source to quickly discharge the power MOSFET gate capacitance.

The drain current is limited to reduce dissipation in case of short circuit load. Refer to OVERLOAD CHARACTERISTICS.

SYMBOL	PARAMETER	REQUIRED CONDITION	MIN.	MAX.	UNIT
$V_{DS}$	<b>Overload protection<sup>3</sup></b> Drain source voltage	protection supply $V_{PS} \geq 4 \text{ V}$	0	35	V

**OVERVOLTAGE CLAMPING LIMITING VALUES**

At a drain source voltage above 50 V the power MOSFET is actively turned on to clamp overvoltage transients.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
$E_{DSM}$	<b>Inductive load turn off</b> Non-repetitive clamping energy	$I_{DM} = 20 \text{ A}; V_{DD} \leq 20 \text{ V}$ $T_{mb} = 25^\circ\text{C}$	-	350	mJ
$E_{DRM}$	Repetitive clamping energy	$T_{mb} \leq 95^\circ\text{C}; f = 250 \text{ Hz}$	-	45	mJ

<sup>1</sup> Prior to the onset of overvoltage clamping. For voltages above this value, safe operation is limited by the overvoltage clamping energy.

<sup>2</sup> A higher  $T_J$  is allowed as an overload condition but at the threshold  $T_{J(TO)}$  the over temperature trip operates to protect the switch.

<sup>3</sup> All control logic and protection functions are disabled during conduction of the source drain diode. If the protection circuit was previously latched, it would be reset by this condition.
