Type-C CC and SBU Short to VBUS Over-Voltage and IEC ESD Protection Switch

General Description

The RT1738A is an USB Type-C interface over-voltage protection IC.

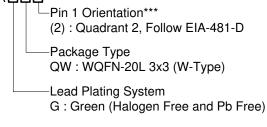

The RT1738A protects the high voltage shorted to VBUS to adjacent pins of CC/SBU up to 28V due to USB Power Delivery (PD) allowing VBUS from 3.3 to 21V sourcing.

The RT1738A is integrated the protection ESDs of IEC61000-4-2 with contact discharge $\pm 8kV$ on CON_CC1/CON_CC2, D1/D2 and $\pm 6kV$ on CON_SBU1/CON_SBU2. The surge immunity level of CON_CC1 /CON_CC2 is up to $\pm 35V$. Besides, the ultra-fast OVP response time of 60ns can protect the system side of application IC from damage.

The RT1738A is available in a 3×3mm WQFN package.

Ordering Information

RT1738A

Note :

***Empty means Pin1 orientation is Quadrant 1

Richtek products are :

- ► RoHS compliant and compatible with the current requirements of IPC/JEDEC J-STD-020.
- Suitable for use in SnPb or Pb-free soldering processes.

Features

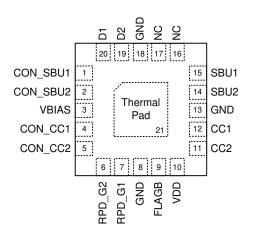

- 4-Channels of Short to VBUS Over-Voltage Protection (CON_CC1, CON_CC2, CON_SBU1, CON_SBU2)
- IEC61000-4-2 Contact Discharge Protection
 ► CON_CC1/CON_CC2 : ±8kV
 - ▶ D1/D2 : ±8kV
 - ► CON_SBU1/CON_SBU2 : ±6kV
- High Absolute Maximum Ratings = 28V of CON_CC1, CON_CC2, CON_SBU1 and CON_SBU2
- 60ns Ultra-Fast OVP Response Time of CC/SBU
- 255m Ω Ultra-Low Ron of CC Switch Typical
- 3.6Ω Low Ron of SBU Switch Typical
- 40µA Low Quiescent Current in Standby
- High Bandwidth of 1.1GHz for SBU Switch
- Dead Battery Support
- 20-Pin 3x3mm WQFN Package

Applications

- PC/Notebook
- Smart Phone/Tablet
- TV/Monitor
- USB-C Dongle/Docking/Hubs

Simplified Application Circuit

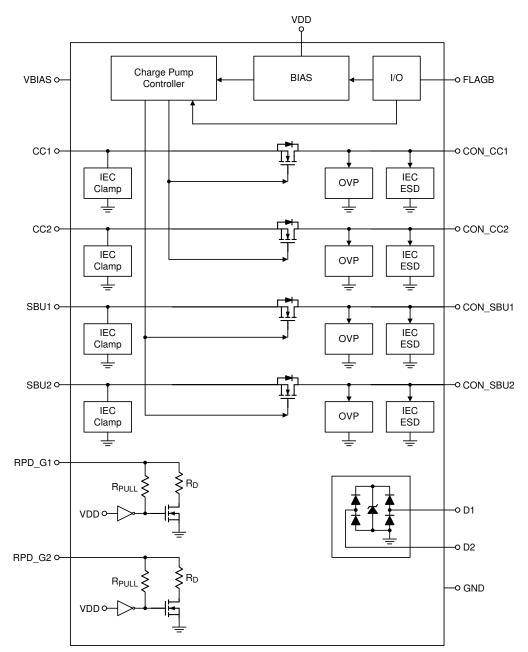

Functional Pin Description

Pin No.	Pin Name	Pin Function			
1	CON_SBU1	Type-C connector side SBU1 switch. Connect SBU1 pin of the USB Type-C connector.			
2	CON_SBU2	Type-C connector side SBU2 switch. Connect SBU2 pin of the USB Type-C connector.			
3	VBIAS	VBIAS pin connect capacitor for ESD protection. Put a $0.1\mu\text{F}$ capacitor on this pin to ground.			
4	CON_CC1	Type-C connector side CC1 switch. Connect CC1 pin of the USB Type-C connector.			
5	CON_CC2	Type-C connector side CC2 switch. Connect CC2 pin of the USB Type-C connector.			
6	RPD_G2	If dead battery resistors are required, short pin to CON_CC2. If dead battery resistors are not required, short pin to GND.			
7	RPD_G1	If dead battery resistors are required, short pin to CON_CC1. If dead battery resistors are not required, short pin to GND.			
8, 13, 18	GND	Ground.			
9	FLAGB	Open-drain output cautioning fault condition.			
10	VDD	2.5V to 5.5V power supply. Bypass VDD to GND with a $1\mu\text{F}$ capacitor.			
11	CC2	System side of the CC2 switch. Connect to CC pin of the CC/PD controller.			
12	CC1	System side of the CC1 switch. Connect to CC pin of the CC/PD controller.			
14	SBU2	System side of the SBU2 switch. Connect to SBU pin of the SBU MUX.			

RT1738A

Pin No.	Pin Name	Pin Function				
15	SBU1	ystem side of the SBU1 switch. Connect to SBU pin of the SBU MUX.				
16, 17	NC	No internal connection. Connect to ground.				
19	D2	USB2.0 IEC ESD protection. Connect to the USB2.0 pins of the USB Type-C connector.				
20	D1	USB2.0 IEC ESD protection. Connect to the USB2.0 pins of the USB Type-C connector.				
	Thermal Pad	Used as a heatsink. Thermal pad connect to PCB ground plane.

Note 1. Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions may affect device reliability.

Note 2. θ_{JA} is measured under natural convection (still air) at $T_A = 25^{\circ}C$ with the component mounted on a high effective-thermal-conductivity four-layer test board on a JEDEC 51-7 thermal measurement standard. θ_{JC} is measured at the exposed pad of the package.

Note 3. Devices are ESD sensitive. Handling precaution is recommended.

Note 4. The device is not guaranteed to function outside its operating conditions.

Application Information

Richtek's component specification does not include the following information in the Application Information section. Thereby no warranty is given regarding its validity and accuracy. Customers should take responsibility to verify their own designs and to ensure the functional suitability of their components and systems.

6-Channels of IEC 61000-4-2 ESD Protection (CON_CC1, CON_CC2, CON_SBU1, CON_SBU2, D1 and D2)

The RT1738A provides 6-Channels of IEC 61000-4-2 system level ESD protection for the CC1, CC2, SBU1, SBU2, D1 and D2 pins. As USB Type-C interface need IEC system level ESD protection in order to provide plenty protection for the ESD events that the connector can be exposed to end users.

Input Over-Voltage Protection

The RT1738A has 4-channels of Short to VBUS overvoltage protection for the CC1, CC2, SBU1 and SBU2 pins of the USB Type-C receptacle via internal OVP level. When the input voltage exceeds the OVP level, the RT1738A will ultra-fast turn off internal switches around 60ns to prevent the high input voltage from damaging the end system. When the CC/SBU input voltage returns to normal operation voltage range with hysteresis 75/60mV, the will turn on the switches to turn on channel.

All switches for CC1/2 and SBU1/2 are each own OVP comparator and controlled by its comparator independently. If any one of channel voltage exceed OVP threshold, the channel switch is turned off, and the others switches are also turned off.

Over-Temperature Protection (OTP)

The RT1738A monitors its internal temperature to prevent thermal failures. The chip turns off the switches when the junction temperature reaches 150°C. The IC will resume after the junction temperature is cooled down 20°C.

Dead Battery

The RT1738A supports dead battery function. If system side haven't enough power to provide the RT1738A work, short the RPD_G1 pin to the CON_CC1 pin, and short the RPD_G2 pin to the CON_CC2 pin. When it is connected to a Source, DRP or Sourcing Device, the system will receive the default VBUS.

If dead battery function is not required in application, connect the RPD_G1 and RPD_G2 pins to ground.

FLAGB Pin Operation

The FLAGB operation for fault reporting. When OVP or OTP event occurred, FLAGB pin will pull low until fault event assert. Time from OVP or OTP to FLAGB pull down is around 20μ s, then time from OVP asserted to FLAGB assertion is around 5ms.

How to Connect Unused Pins

If the RPD_Gx pins, the Dx pins and the NC pin 16, 17 are unused in a design, they must be connected to GND.

Device Functional Modes

The RT1738A all functional modes.

	MODE	VDD	RPD_Gx	TJ	FLAGB	CC Switches	SBU Switches
Normal Operating Conditions	Powered Off No Dead Battery Support	< UVLO	Grounded		High-Z	OFF	OFF
	Powered Off Dead Battery Support	< UVLO	Shorted to CON_CCx		High-Z	OFF	OFF
	Powered On	> UVLO	Forced OFF	< 0T	High-Z	ON	ON
	Thermal shutdown	> UVLO	Forced OFF	> OT	Low	OFF	OFF
Fault Conditions	CC Over-Voltage Condition	> UVLO	Forced OFF	< 0T	Low	OFF	OFF
	SBU Over-Voltage Condition	> UVLO	Forced OFF	< 0T	Low	OFF	OFF

Thermal Considerations

The junction temperature should never exceed the absolute maximum junction temperature $T_{J(MAX)}$, listed under Absolute Maximum Ratings, to avoid permanent damage to the device. The maximum allowable power dissipation depends on the thermal resistance of the IC package, the PCB layout, the rate of surrounding airflow, and the difference between the junction and ambient temperatures. The maximum power dissipation can be calculated using the following formula :

 $\mathsf{P}_{\mathsf{D}(\mathsf{MAX})} = (\mathsf{T}_{\mathsf{J}(\mathsf{MAX})} - \mathsf{T}_{\mathsf{A}}) / \theta_{\mathsf{J}\mathsf{A}}$

where $T_{J(MAX)}$ is the maximum junction temperature, TA is the ambient temperature, and θ_{JA} is the junction-to-ambient thermal resistance.

For continuous operation, the maximum operating junction temperature indicated under Recommended Conditions 125°C. The Operating is junction-to-ambient thermal resistance, θ_{JA} , is highly package dependent. For a WQFN-20L 3x3 package, the thermal resistance, θ_{JA} , is 30°C/W on a standard JEDEC 51-7 high effective-thermal-conductivity four-layer test board. The maximum power dissipation at TA = 25°C can be calculated as below :

 $\mathsf{PD}(\mathsf{MAX})$ = (125°C - 25°C) / (30°C/W) = 3.33W for a WQFN-20L 3x3 package.

The maximum power dissipation depends on the operating ambient temperature for the fixed $T_{J}(MAX)$ and the thermal resistance, θ_{JA} . The derating curves in Figure 1 allows the designer to see the effect of rising ambient temperature on the maximum power dissipation.

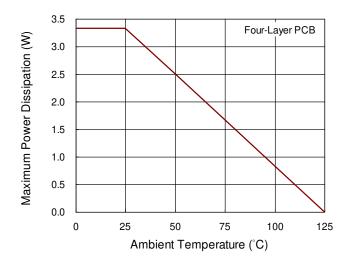

Figure 1. Derating Curve of Maximum Power Dissipation

Layout Considerations

Appropriate routing and placement is significant to maintain the signal integrity the USB2.0, SBU, CC signals. The following guidelines apply to the RT1738A: Place the bypass capacitors close to the VDD pin, and ESD protection capacitor close to the VBIAS pin. Capacitors must be attached to a solid ground. This minimizes voltage disturbances during such as short to VBUS and ESD event. The USB2.0 and SBU trace need to be routed straight and sharp bends must be minimized.

Standard ESD suggestion apply to the CON_CC1, CON _CC2, CON _SBU1, CON _SBU2, D1, and D2 pins as well :

The optimum placement for the device is as close to the connector as possible. The PCB designer must be keeping out unprotected traces away from the protected traces which are between the RT1738A and the connector.

Route the protected path as straight as possible. Reduce any sharp corners on the protected traces between the connector by using rounded corners with the largest radii possible. Suggest to reduce Dx pin via up to another layer and to continue that trace on that same layer.

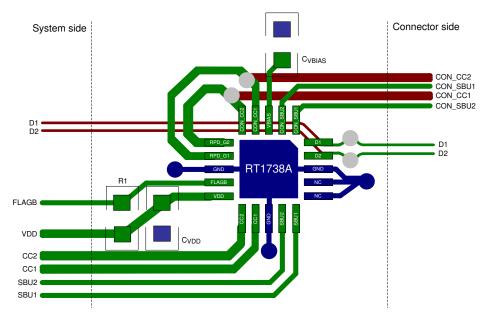

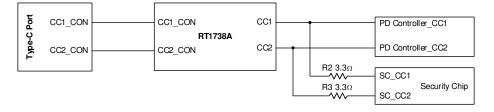

Figure 2. RT1738A Layout Guide

CC1 and CC2 Add Series Resistor with Security Chip

The RT1738A is applied with the factory customization's security chip platform that need CC1 and CC2 add series resistor with security chip. The security chip CC AMR is lower than 6V that but RT1738A CC AMR is 6V. That will have a system IEC61000-4-2 ESD test fail issue and cause to security chip damage. Add a series 3.3Ω resistor with security chip can be avoided ESD fail, that will system IEC61000-4-2 ESD contact discharge ±8kV pass. Then if RT1738A's application with factory customization's security chip, the proposal schematic is as shown below :
