

LM5109B-Q1 High Voltage 1-A Peak Half Bridge Gate Driver

1 Features

- Qualified for Automotive Applications
- AEC-Q100 Qualified With the Following Results
 - Device Temperature Grade 1
 - Device HBM ESD Classification Level 1C
 - Device CDM ESD Classification Level C4A
- Drives Both a High-Side and Low-Side N-Channel MOSFET
- 1-A Peak Output Current (1.0-A Sink/1.0-A Source)
- Independent TTL/CMOS Compatible Inputs
- Bootstrap Supply Voltage to 108-V DC
- Fast Propagation Times (30 ns Typical)
- Drives 1000-pF Load with 15-ns Rise and Fall Times
- Excellent Propagation Delay Matching (2 ns Typical)
- Supply Rail Under-Voltage Lockout
- Low Power Consumption
- Thermally-Enhanced WSON-8 Package

2 Applications

- Push-Pull Converters
- Half and Full Bridge Power Converters
- Solid State Motor Drives
- Two Switch Forward Power Converters

3 Description

The LM5109B-Q1 is a cost effective, high voltage gate driver designed to drive both the high-side and the low-side N-Channel MOSFETs in a synchronous buck or a half bridge configuration. The floating high-side driver is capable of working with rail voltages up to 90 V. The outputs are independently controlled with TTL/CMOS compatible logic input thresholds. The robust level shift technology operates at high speed while consuming low power and providing clean level transitions from the control input logic to the high-side gate driver. Under-voltage lockout is provided on both the low-side and the high-side power rails. The device is available in the thermally enhanced WSON(8) packages.

5 Pin Configuration and Functions

Pin Functions

PIN		I/O ⁽¹⁾	DESCRIPTION	APPLICATIONS INFORMATION
NO. ⁽²⁾	NAME			
1	V _{DD}	P	Positive gate drive supply	Locally decouple to V _{SS} using low ESR/ESL capacitor located as close to IC as possible.
2	HI	I	High side control input	The HI input is TTL/CMOS Compatible input thresholds. Unused HI input should be tied to ground and not left open.
3	LI	I	Low side control input	The LI input is TTL/CMOS Compatible input thresholds. Unused LI input should be tied to ground and not left open.
4	V _{SS}	G	Ground reference	All signals are referenced to this ground.
5	LO	O	Low side gate driver output	Connect to the gate of the low-side N-MOS device.
6	HS	P	High side source connection	Connect to the negative terminal of the bootstrap capacitor and to the source of the high-side N-MOS device.
7	HO	O	High side gate driver output	Connect to the gate of the high-side N-MOS device.
8	HB	P	High side gate driver positive supply rail	Connect the positive terminal of the bootstrap capacitor to HB and the negative terminal of the bootstrap capacitor to HS. The bootstrap capacitor should be placed as close to IC as possible.

(1) P = Power, G = Ground, I = Input, O = Output, I/O = Input/Output

(2) For WSON-8 package, it is recommended that the exposed pad on the bottom of the package be soldered to ground plane on the PCB and the ground plane should extend out from underneath the package to improve heat dissipation.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

	MIN	MAX	UNIT
V _{DD} to V _{SS}	-0.3	18	V
HB to HS	-0.3	18	V
LI or HI to V _{SS}	-0.3	V _{DD} + 0.3	V
LO to V _{SS}	-0.3	V _{DD} + 0.3	V
HO to V _{SS}	V _{HS} - 0.3	V _{HB} + 0.3	V
HS to V _{SS} ⁽²⁾	-5	90	V
HB to V _{SS}		108	V
Junction temperature	-40	150	°C
Storage temperature, T _{stg}	-55	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) In the application, the HS node is clamped by the body diode of the external lower N-MOSFET, therefore the HS voltage will generally not exceed -1 V. However in some applications, board resistance and inductance may result in the HS node exceeding this stated voltage transiently. If negative transients occur on HS, the HS voltage must never be more negative than V_{DD} - 15 V. For example, if V_{DD} = 10 V, the negative transients at HS must not exceed -5 V.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD) Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 ⁽¹⁾	1500	V
	Charged-device model (CDM), per AEC Q100-011	750	

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	NOM	MAX	UNIT
V _{DD}	8		14	V
HS ⁽¹⁾	-1		90	V
HB	V _{HS} +8		V _{HS} +14	V
HS Slew Rate			< 50	V/ns
Junction Temperature	-40		125	°C

- (1) In the application, the HS node is clamped by the body diode of the external lower N-MOSFET, therefore the HS voltage will generally not exceed -1 V. However in some applications, board resistance and inductance may result in the HS node exceeding this stated voltage transiently. If negative transients occur on HS, the HS voltage must never be more negative than V_{DD} - 15 V. For example, if V_{DD} = 10 V, the negative transients at HS must not exceed -5 V.

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		LM5109B-Q1	UNIT
		NGT (WSON)	
		8-PINS	
R _{θJA}	Junction-to-ambient thermal resistance	42.3	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	34.0	°C/W
R _{θJB}	Junction-to-board thermal resistance	19.3	°C/W
ψ _{JT}	Junction-to-top characterization parameter	0.4	°C/W
ψ _{JB}	Junction-to-board characterization parameter	19.5	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	8.1	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report (SPRA953).

6.5 Electrical Characteristics

T_J = 25°C (unless otherwise noted)

V_{DD} = V_{HB} = 12 V, V_{SS} = V_{HS} = 0 V, No Load on LO or HO.

7 Detailed Description

7.1 Overview

The LM5109B-Q1 is a cost-effective, high voltage gate driver designed to drive both the high-side and the low-side N-channel FETs in a synchronous buck or a half-bridge configuration. The outputs are independently controlled with TTL/CMOS compatible input thresholds. The floating high-side driver is capable of working with HB voltage up to 108 V. An external high voltage diode must be provided to charge high side gate drive bootstrap capacitor. A robust level shifter operates at high speed while consuming low power and providing clean level transitions from the control logic to the high side gate driver. Under-voltage lockout (UVLO) is provided on both the low side and the high side power rails.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Start-up and UVLO

Both top and bottom drivers include UVLO protection circuitry which monitors the supply voltage (V_{DD}) and bootstrap capacitor voltage (V_{HB-HS}) independently. The UVLO circuit inhibits each output until sufficient supply voltage is available to turn on the external MOSFETs, and the built-in UVLO hysteresis prevents chattering during supply voltage variations. When the supply voltage is applied to the VDD pin of the LM5109B-Q1, the top and bottom gates are held low until V_{DD} exceeds the UVLO threshold, typically about 6.7 V. Any UVLO condition on the bootstrap capacitor (V_{HB-HS}) will only disable the high-side output (HO).

Table 1. VDD UVLO Feature Logic Operation

Condition ($V_{HB-HS} > V_{HBR}$ for all case below)	HI	LI	HO	LO
$V_{DD} - V_{SS} < V_{DDR}$ during device start-up	H	L	L	L
$V_{DD} - V_{SS} < V_{DDR}$ during device start-up	L	H	L	L
$V_{DD} - V_{SS} < V_{DDR}$ during device start-up	H	H	L	L
$V_{DD} - V_{SS} < V_{DDR}$ during device start-up	L	L	L	L
$V_{DD} - V_{SS} < V_{DDR} - V_{DDH}$ after device start-up	H	L	L	L
$V_{DD} - V_{SS} < V_{DDR} - V_{DDH}$ after device start-up	L	H	L	L
$V_{DD} - V_{SS} < V_{DDR} - V_{DDH}$ after device start-up	H	H	L	L
$V_{DD} - V_{SS} < V_{DDR} - V_{DDH}$ after device start-up	L	L	L	L

Table 2. VHB-HS UVLO Feature Logic Operation

Condition ($V_{DD} > V_{DDR}$ for all case below)	HI	LI	HO	LO
$V_{HB-HS} < V_{HBR}$ during device start-up	H	L	L	L
$V_{HB-HS} < V_{HBR}$ during device start-up	L	H	L	H
$V_{HB-HS} < V_{HBR}$ during device start-up	H	H	L	H
$V_{HB-HS} < V_{HBR}$ during device start-up	L	L	L	L
$V_{HB-HS} < V_{HBR} - V_{HBH}$ after device start-up	H	L	L	L
$V_{HB-HS} < V_{HBR} - V_{HBH}$ after device start-up	L	H	L	H
$V_{HB-HS} < V_{HBR} - V_{HBH}$ after device start-up	H	H	L	H
$V_{HB-HS} < V_{HBR} - V_{HBH}$ after device start-up	L	L	L	L

7.3.2 Level Shift

The level shift circuit is the interface from the high-side input to the high-side driver stage which is referenced to the switch node (HS). The level shift allows control of the HO output which is referenced to the HS pin and provides excellent delay matching with the low-side driver.

7.3.3 Output Stages

The output stages are the interface to the power MOSFETs in the power train. High slew rate, low resistance, and high peak current capability of both outputs allow for efficient switching of the power MOSFETs. The low-side output stage is referenced to VSS and the high-side is referenced to HS.

7.4 HS Transient Voltages Below Ground

The HS node will always be clamped by the body diode of the lower external FET. In some situations, board resistances and inductances can cause the HS node to transiently swing several volts below ground. The HS node can swing below ground provided:

1. HS must always be at a lower potential than HO. Pulling HO more than -0.3 V below HS can activate parasitic transistors resulting in excessive current flow from the HB supply, possibly resulting in damage to the IC. The same relationship is true with LO and VSS. If necessary, a Schottky diode can be placed externally between HO and HS or LO and GND to protect the IC from this type of transient. The diode must be placed as close to the IC pins as possible in order to be effective.
2. HB to HS operating voltage should be 15 V or less. Hence, if the HS pin transient voltage is -5 V, VDD should be ideally limited to 10 V to keep HB to HS below 15 V.
3. Low ESR bypass capacitors from HB to HS and from VDD to VSS are essential for proper operation. The capacitor should be located at the leads of the IC to minimize series inductance. The peak currents from LO and HO can be quite large. Any series inductances with the bypass capacitor will cause voltage ringing at the leads of the IC which must be avoided for reliable operation.

7.5 Device Functional Modes

The device operates in normal mode and UVLO mode. See [Start-up and UVLO](#) for more information on UVLO operation mode. In normal mode when the V_{DD} and V_{HB-HS} are above UVLO threshold, the output stage is dependent on the states of the HI and LI pins. The output HO and LO will be low if input state is floating.

Table 3. INPUT/OUTPUT Logic Table

HI	LI	HO ⁽¹⁾	LO ⁽²⁾
L	L	L	L
L	H	L	H
H	L	H	L
H	H	H	H
Floating	Floating	L	L

- (1) HO is measured with respect to the HS.
 (2) LO is measured with respect to the VSS.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

To operate fast switching of power MOSFETs at high switching frequencies and to reduce associated switching losses, a powerful gate driver is employed between the PWM output of controller and the gates of the power semiconductor devices. Also, gate drivers are indispensable when it is impossible for the PWM controller to directly drive the gates of the switching devices. With the advent of digital power, this situation is often encountered because the PWM signal from the digital controller is often a 3.3 V logic signal which cannot effectively turn on a power switch. Level shift circuit is needed to boost the 3.3 V signal to the gate-drive voltage (such as 12 V) in order to fully turn-on the power device and minimize conduction losses. Traditional buffer drive circuits based on NPN/PNP bipolar transistors in totem-pole arrangement prove inadequate with digital power because they lack level-shifting capability. Gate drivers effectively combine both the level-shifting and buffer-drive functions. Gate drivers also find other needs such as minimizing the effect of high-frequency switching noise (by placing the high-current driver IC physically close to the power switch), driving gate-drive transformers and controlling floating power-device gates, reducing power dissipation and thermal stress in controllers by moving gate charge power losses from the controller into the driver.

The LM5109B-Q1 is the high voltage gate drivers designed to drive both the high-side and low-side N-Channel MOSFETs in a half-bridge/full bridge configuration or in a synchronous buck circuit. The floating high side driver is capable of operating with supply voltages up to 90V. This allows for N-Channel MOSFETs control in half-bridge, full-bridge, push-pull, two switch forward and active clamp topologies. The outputs are independently controlled. Each channel is controlled by its respective input pins (HI and LI), allowing full and independent flexibility to control ON and OFF state of the output.

8.2 Typical Application

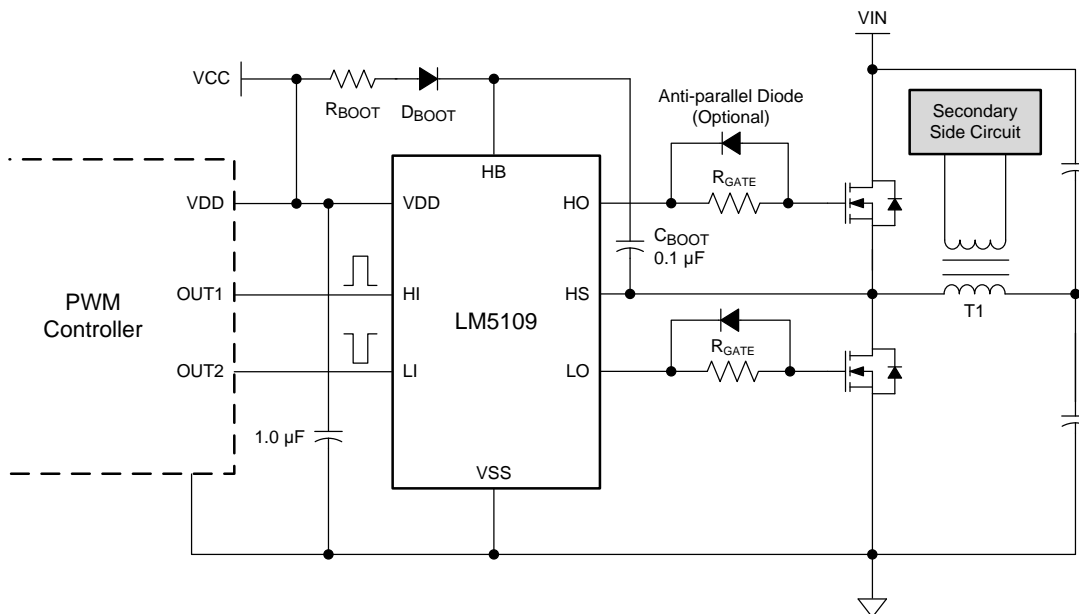

Figure 14. LM5109B-Q1 Driving MOSFETs in a Half Bridge Converter

Typical Application (continued)

8.2.1 Design Requirements

Table 4. Design Example

PARAMETER	VALUE
Gate Driver	LM5109B-Q1
MOSFET	CSD19534KCS
V _{DD}	10 V
Q _G	17 nC
f _{SW}	500 kHz

8.2.2 Detailed Design Procedure

8.2.2.1 Select Bootstrap and VDD Capacitor

The bootstrap capacitor must maintain the V_{HB-HS} voltage above the UVLO threshold for normal operation. Calculate the maximum allowable drop across the bootstrap capacitor with [Equation 1](#).

$$\Delta V_{HB} = V_{DD} - V_{DH} - V_{HBL} = 10 \text{ V} - 1 \text{ V} - 6.7 \text{ V} = 2.3 \text{ V}$$

where

- V_{DD} = Supply voltage of the gate drive IC;
 - V_{DH} = Bootstrap diode forward voltage drop;
 - V_{HBL} = V_{HBRmax} - V_{HBH}, HB falling threshold;
- (1)

Then, the total charge needed per switching cycle could be estimated by [Equation 2](#).

$$Q_{\text{Total}} = Q_G + I_{\text{HBS}} \times \frac{D_{\text{Max}}}{f_{\text{SW}}} + \frac{I_{\text{HB}}}{f_{\text{SW}}} = 17 \text{ nC} + 10 \mu\text{A} \times \frac{0.95}{500 \text{ kHz}} + \frac{0.2 \text{ mA}}{500 \text{ kHz}} = 17.5 \text{ nC}$$

where

- Q_G: Total MOSFET gate charge
 - I_{HBS}: HB to VSS Leakage current
 - D_{Max}: Converter maximum duty cycle
 - I_{HB}: HB Quiescent current
- (2)

Therefore, the minimum C_{Boot} should be:

$$C_{\text{Boot}} = \frac{Q_{\text{Total}}}{\Delta V_{HB}} = \frac{17.5 \text{ nC}}{2.3 \text{ V}} = 7.6 \text{ nF}$$
(3)

In practice, the value of the C_{Boot} capacitor should be greater than calculated to allow for situations where the power stage may skip pulse due to load transients. It is recommended to have enough margins and place the bootstrap capacitor as close to the HB and HS pins as possible.

$$C_{\text{Boot}} = 100 \text{ nF}$$
(4)

As a general rule the local V_{DD} bypass capacitor should be 10 times greater than the value of C_{Boot}, as shown in [Equation 5](#).

$$C_{\text{VDD}} = 1 \mu\text{F}$$
(5)

The bootstrap and bias capacitors should be ceramic types with X7R dielectric. The voltage rating should be twice that of the maximum V_{DD} considering capacitance tolerances once the devices have a DC bias voltage across them and to ensure long-term reliability.

8.2.2.2 Select External Bootstrap Diode and Its Series Resistor

The bootstrap capacitor is charged by the V_{DD} through the external bootstrap diode every cycle when low side MOSFET turns on. The charging of the capacitor involves high peak currents, and therefore transient power dissipation in the bootstrap diode may be significant and the conduction loss also depends on its forward voltage drop. Both the diode conduction losses and reverse recovery losses contribute to the total losses in the gate driver circuit.

For the selection of external bootstrap diodes, please refer to the application note SNVA083A. Bootstrap resistor R_{BOOT} is selected to reduce the inrush current in D_{BOOT} and limit the ramp up slew rate of voltage of V_{HB-HS} during each switching cycle, especially when HS pin have excessive negative transient voltage. R_{BOOT} recommended value is between $2\ \Omega$ and $10\ \Omega$ depending on diode selection. A current limiting resistor of $2.2\ \Omega$ is selected to limit inrush current of bootstrap diode, and the estimated peak current on the D_{Boot} is shown in [Equation 6](#).

$$I_{DBoot(pk)} = \frac{V_{DD} - V_{DH}}{R_{Boot}} = \frac{10\text{ V} - 1\text{ V}}{2.2\ \Omega} \approx 4\text{ A}$$

where

- V_{DH} is the Bootstrap diode forward voltage drop (6)

8.2.2.3 Selecting External Gate Driver Resistor

External Gate Driver Resistor, R_{GATE} , is sized to reduce ringing caused by parasitic inductances and capacitances and also to limit the current coming out of the gate driver.

Peak HO pull-up current are calculated by the following equations.

$$I_{OHH} = \frac{V_{DD} - V_{DH}}{R_{HOH} + R_{Gate} + R_{GFET_Int}} = \frac{10\text{ V} - 1\text{ V}}{1.2\text{ V} / 100\text{ mA} + 4.7\ \Omega + 2.2\ \Omega} = 0.48\text{ A}$$

where

- I_{OHH} – Peak pull-up current;
- V_{DH} – Bootstrap diode forward voltage drop;
- R_{HOH} – Gate driver internal HO pull-up resistance, provide by driver datasheet directly or estimated from the testing conditions, i.e. $R_{HOH} = V_{OHH} / I_{HO}$;
- R_{Gate} – External gate drive resistance;
- $R_{(GFET_Int)}$ – MOSFET internal gate resistance, provided by transistor datasheet; (7)

Similarly, Peak HO pull-down current is shown in [Equation 8](#).

$$I_{OLH} = \frac{V_{DD} - V_{DH}}{R_{HOL} + R_{Gate} + R_{GFET_Int}}$$

where

- R_{HOL} is HO pull-down resistance (8)

Peak LO pullup current is shown in [Equation 9](#).

$$I_{OHL} = \frac{V_{DD}}{R_{LOH} + R_{Gate} + R_{GFET_Int}}$$

where

- R_{LOH} is LO pull-up resistance. (9)

Peak LO pulldown current is shown in [Equation 10](#).

$$I_{OLL} = \frac{V_{DD}}{R_{LOL} + R_{Gate} + R_{GFET_Int}}$$

where

- R_{LOL} is LO pull-down resistance (10)

For some scenarios, if the applications require fast turn-off, an anti-paralleled diode on R_{Gate} could be used to bypass the external gate drive resistor and speed-up turn-off transition.

8.2.2.4 Estimate the Driver Power Loss

The total driver IC power dissipation can be estimated through the following components.

1. Static power losses, P_{QC} , due to quiescent current – I_{DD} and I_{HB} ;

$$P_{QC} = V_{DD} \times I_{DD} + (V_{DD} - V_{DH}) \times I_{HB} \quad (11)$$

2. Level-shifter losses, P_{IHBS} , due high side leakage current – IHBS;

$$P_{IHBS} = V_{HB} \times I_{HBS} \times D$$

where

- D is high side switch duty cycle (12)

3. Dynamic losses, $P_{QG1\&2}$, due to the FETs gate charge – Q_G ;

$$P_{QG1\&2} = 2 \times V_{DD} \times Q_G \times f_{SW} \times \frac{R_{GD_R}}{R_{GD_R} + R_{Gate} + R_{GFET_Int}}$$

where

- Q_G is total FETs gate charge;
- f_{SW} is switching frequency;
- R_{GD_R} is average value of pull-up and pull-down resistor;
- R_{Gate} is external gate drive resistor;
- R_{GFET_Int} is internal FETs gate resistor; (13)

4. Level-shifter dynamic losses, P_{LS} , during high side switching due to required level-shifter charge on each switching cycle – Q_P ;

$$P_{LS} = V_{HB} \times Q_P \times f_{SW} \quad (14)$$

In this example, the estimated gate driver loss in LM5109B-Q1 is shown in [Equation 15](#).

$$P_{LM5109BQ} = 10 \text{ V} \times 0.6 \text{ mA} + 9 \text{ V} \times 0.2 \text{ mA} + 72 \text{ V} \times 10 \text{ } \mu\text{A} \times 0.95 + 2 \times 10 \times 17 \text{ nC} \times 500 \text{ kHz} \times \frac{12 \text{ } \Omega}{12 \text{ } \Omega + 4.7 \text{ } \Omega + 2.2 \text{ } \Omega} + 72 \text{ V} \times 0.5 \text{ nC} \times 500 \text{ kHz} = 0.134 \text{ W} \quad (15)$$

For a given ambient temperature, the maximum allowable power loss of the IC can be defined as shown in [Equation 16](#).

$$P_{LM5109BQ} = \frac{T_J - T_A}{R_{\theta JA}}$$

where

- $P_{LM5109BQ}$ = The total power dissipation of the driver
- T_J = Junction temperature
- T_A = Ambient temperature
- $R_{\theta JA}$ = Junction-to-ambient thermal resistance (16)

The thermal metrics for the driver package is summarized in the Thermal Information section of the datasheet. For detailed information regarding the thermal information table, please refer to the Texas Instruments application note entitled *Semiconductor and IC Package Thermal Metrics* ([SPRA953](#)).

8.2.3 Application Curves

[Figure 15](#) and [Figure 16](#) shows the rising/falling time and turn-on/off propagation delay testing waveform in room temperature, and waveform measurement data (see the bottom part of the waveform). Each channel, HI/LI/HO/LO, is labeled and displayed on the left hand of the waveforms.

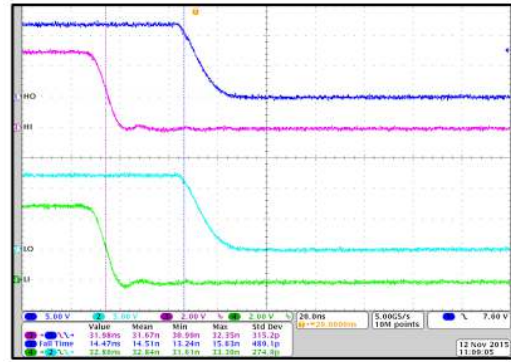

The testing condition: load capacitance is 1 nF, $V_{DD} = 12 \text{ V}$, $f_{SW} = 500 \text{ kHz}$.

HI and LI share one same input from function generator, therefore, besides the propagation delay and rising/falling time, the difference of the propagation delay between HO and LO gives the propagation delay matching data.

$C_L = 1 \text{ nF}$ $V_{DD} = 12 \text{ V}$ $f_{SW} = 500 \text{ kHz}$

Figure 15. Rising Time and Turn-On Propagation Delay

$C_L = 1 \text{ nF}$ $V_{DD} = 12 \text{ V}$ $f_{SW} = 500 \text{ kHz}$

Figure 16. Falling Time and Turn-Off Propagation Delay

9 Power Supply Recommendations

The recommended bias supply voltage range for LM5109B-Q1 is from 8 V to 14 V. The lower end of this range is governed by the internal under voltage-lockout (UVLO) protection feature of the V_{DD} supply circuit blocks. The upper-end of this range is driven by the 18-V absolute maximum voltage rating of the V_{DD} . It is recommended to keep a 4-V margin to allow for transient voltage spikes.

The UVLO protection feature also involves a hysteresis function. This means that once the device is operating in normal mode, if the V_{DD} voltage drops, the device continues to operate in normal mode as far as the voltage drop do not exceeds the hysteresis specification, V_{DDH} . If the voltage drop is more than hysteresis specification, the device will shut down. Therefore, while operating at or near the 8-V range, the voltage ripple on the auxiliary power supply output should be smaller than the hysteresis specification of LM5109B-Q1 to avoid triggering device-shutdown.

A local bypass capacitor should be placed between the VDD and GND pins. And this capacitor should be located as close to the device as possible. A low ESR, ceramic surface mount capacitor is recommended. TI recommends using 2 capacitors across VDD and GND: a 100 nF ceramic surface-mount capacitor for high frequency filtering placed very close to VDD and GND pin, and another surface-mount capacitor, 220 nF to 10 μ F, for IC bias requirements. In a similar manner, the current pulses delivered by the HO pin are sourced from the HB pin. Therefore, a 22-nF to 220-nF local decoupling capacitor is recommended between the HB and HS pins.

10 Layout

10.1 Layout Guidelines

Optimum performance of high and low-side gate drivers cannot be achieved without taking due considerations during circuit board layout. The following points are emphasized:

1. Low ESR/ESL capacitors must be connected close to the IC between VDD and VSS pins and between HB and HS pins to support high peak currents drawn from VDD and HB during the turn-on of the external MOSFETs.
2. To prevent large voltage transients at the drain of the top MOSFET, a low ESR electrolytic capacitor and a good quality ceramic capacitor must be connected between the MOSFET drain and ground (VSS).
3. In order to avoid large negative transients on the switch node (HS) pin, the parasitic inductances between the source of the high side MOSFET and the drain of the low side MOSFET (synchronous rectifier) must be minimized.
4. Grounding considerations:
 - The first priority in designing grounding connections is to confine the high peak currents that charge and discharge the MOSFET gates to a minimal physical area. This will decrease the loop inductance and minimize noise issues on the gate terminals of the MOSFETs. The gate driver should be placed as close as possible to the MOSFETs.
 - The second consideration is the high current path that includes the bootstrap capacitor, the bootstrap diode, the local ground referenced bypass capacitor, and the low-side MOSFET body diode. The bootstrap capacitor is recharged on a cycle-by-cycle basis through the bootstrap diode from the ground referenced VDD bypass capacitor. The recharging occurs in a short time interval and involves high peak current. Minimizing this loop length and area on the circuit board is important to ensure reliable operation.

11 Device and Documentation Support

11.1 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

11.2 Trademarks

E2E is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

11.3 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

11.4 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LM5109BQNGTRQ1	ACTIVE	WSON	NGT	8	4500	RoHS & Green	SN	Level-1-260C-UNLIM	-40 to 125	L5109Q	Samples
LM5109BQNGTTQ1	ACTIVE	WSON	NGT	8	1000	RoHS & Green	SN	Level-1-260C-UNLIM	-40 to 125	L5109Q	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
