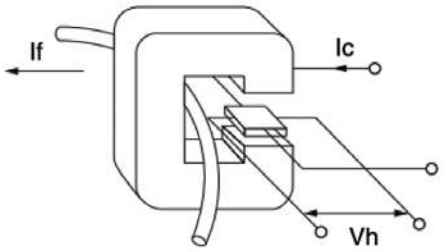
Outlines

The current sensor is a sensor to measure the current as its name. However, The current is various. There is a current value up to 10k amperes treated in the power plant from 1mA, and the shape of current waves also has AC, DC, and AC + DC. Since a method and a structure the best in each measuring object are different, there are also various current sensors. Tamura supplies the sensor using the Hall-Effect system for measuring the current value from several amperes to several kilo-ampere.

The Hall-Effect current sensor measures the magnetic flux produced in proportion to the primary current without any direct contact with the primary circuit; the combination of the Hall element and magnetic circuit provide excellent solution for measuring AC/ DC current with galvanic isolation and zero insertion loss.
The diagram in Figure-1 depicts the Hall current sensor basic principle. The magnetic flux produced in proportion to the primary current, If, induced in the magnetic circuit, passes through the Hall element inserted in the gap of the magnetic circuit resulting in a potential difference, Vh, expressed by the following formula:



Vh = k · Ic · B ····· (1)

- Vh ····· Hall voltage
- K ····· Coefficient of sensibility
- Ic ····· Control current
- B ····· Magnetic fluxdensity

The induced Vh is small and is amplified by an amplification circuit.

Figure-1

Applications

Current control and detection of over-current in various types of inverters. Used for general-purpose inverter, various types of power conversion equipment to control and to detect over-current. Also used to measure DC current from the battery.

- Various types of inverters (CVCF, vector), Industrial robots, automation, devices, NC
- UPS, Elevator, Laser Cutting Machines, Welding Machines, Various types of Regulated Power Supply
- Solar power generation systems, Wind power systems, Fuel cell systems

Features

Measurement of DC, AC (kHz range), & complex current (AC+DC). The lineup of rated currents ranges from a few A to over 1000 A.

- Galvanic isolation with many UL compliant configurations.
- Fast response time
- High Reliability

Circuit system

Tamura offers multiple current sensor options to meet application requirements : Open Loop or Linear type (magnetic proportionality); Closed Loop or Servo-type (magnetic balance) ; Flux-Gate (magnetic equilibrium).

Open loop

If the current is applied to the cable, the magnetic field proportional to the current in surroundings of the cable is generated on Ampere's rule. The magnetic core is set in surroundings of the cable to improve the sensitivity. The Magnetic field is converted into the voltage by the linear type - hall element is placed in the gap of the magnetic core. But the output voltage of hall element is several tens of milli-volt, It enlarges it to the output voltage of the product specification (several volts) by the operational amplifier.

The sensor output voltage is linearly proportional to the magnetic flux generated by the measured current. In general, the open loop sensor is voltage output. The characteristic (accuracy, linearity, response, temperature property, and high-frequency current*1, etc.) of the current sensor is not a little better than that of other circuit methods because of the difference of the circuit configuration (magnetic circuit , magnetism-electric conversion and amplification of electrical circuit). However, the size can be reduced and it is lower -cost more than other circuit methods.

*1-We use silicon steel and permalloy in internal magnetic core of the open-loop sensors in order to improve the measurement possible current and hysteresis error. Therefore, at the frequency of the applied current exceeds more than several KHz, there is a possibility that the internal circuit may be damaged by the heat generation of the core loss.

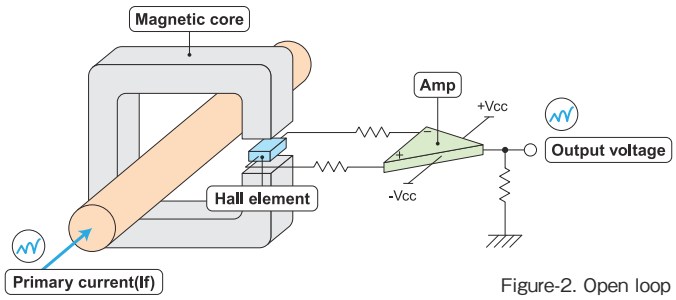

Figure-2. Open loop

Closed loop

The closed loop type current sensor measures the applied current on the condition that the magnetic flux density in the magnetic core is extremely zero. Therefore, there is no influence on accuracy by the non-linearity and hysteresis in the core because the flux density in the magnetic core operates in the starting point of the B-H curve in the operation region*1. The characteristic of the closed loop type is better than the open loop type current sensor.

The addition of a secondary winding (1000-5000 turns) on the magnetic core allows feedback current to be supplied in opposition to measured current to compensate or cancel the magnetic flux generated by the measured current. The output of the closed loop sensor is a current output proportional to the measured current divided by the number of secondary winding turns*2.

*1-At the high-frequency current (1-2kHz or more) and the pulse current, current sensor should operate at ACCT (transformer) because the loop gain of the feedback control decreases. Under such a condition, the magnetic flux in the magnetic core is generated .

*2-Output current = (Primary current) / (Secondary winding turns)

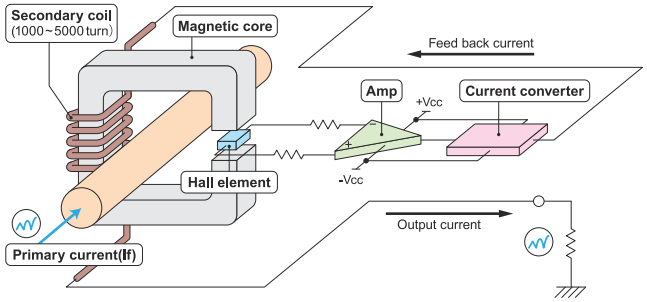

Figure-3. Closed loop

Fluxgate system

The flux-gate current sensor replaces the Hall element with probe coil made of highly saturable material. The magnetic offset of the probe coil does not occur in order to be driven by high-frequency current. The flux-gate utilizes a magnetic balance system to achieve high accuracy, temperature stable current output typically converted to a voltage output with an internal high precision resistor.

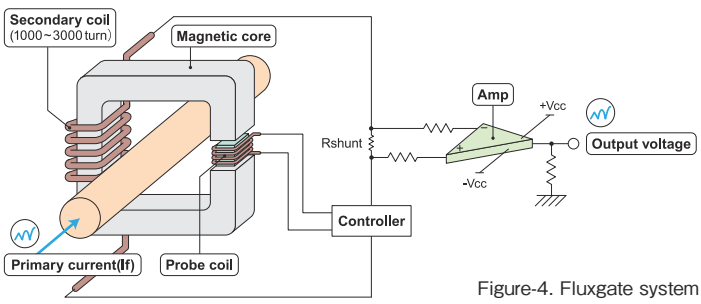

Figure-4. Fluxgate system

Application notes

<General Considerations>

1. The sensor uses polar electronic components. When the polarity of the power supply is mistaken, the sensor is damaged.
2. Static electricity or excessive voltage can increase an offset voltage in the Hall element, and cause offset voltage to change. Please exercise care in handling and application.
3. In order to prevent the influence of noise, the use of twisted cable or shielded cable for the output line is recommended
4. If using this device within a magnetic field generated by other devices, the specified accuracy may not be obtainable.
5. Our products (several models are excluded) are adjusted with the trimming method by the measurement condition (Load resistance, Power supply voltage) of specification sheets. Therefore, characteristics (Offset, Output, etc.) and its deviation may be changed in different circuit conditions from the measurement condition. All change characteristic items are not indicated on specification sheets.
6. The performance of current sensors with through-hole (aperture) is dependent on the position of the primary conductor. Tamura specifications are based on a primary conductor completely filling the through-hole (aperture) area.
7. The current sensor rated current in DC Amps.
8. Please use mating connector with equivalent terminal plating material to insure proper operation and avoid possibility of 'galvanic corrosion' .
9. Please do not store in high-temperature and high-humidity storage environment. Please use it after confirming soldering when it is kept for six months or more. (product soldered with substrate)
10. We recommend performing a zero offset adjustment by measuring the offset voltage at startup. In continuously operation for a few months, or at change of ambient temperature or humidity is large, we recommend regularly performing a zero offset adjustment at being idling (it is clear that the current is not apply) .
11. The current sensor doesn't have built-in protection circuit (devices and fuses, etc.). As a failure mode of the sensor, there is a short circuit and open state. In the case of a short-circuit state, the abnor-mal temperature rise of the internal parts is assumed, and there is a possibility to smoke and to ignite. If it is used in safety critical circuit blocks, please take appropriate measures by protection devices, protection circuits, etc. For closed loop –type sensors and flux gate (closed loop type) sensors, the consumption current of the secondary power supply varies in proportion to the measurement current.

<Open loop>

1. High frequency primary current may result in excessive heating in iron magnetic core and cause damage to internal circuitry; for high frequency applications select current sensor with ferrite core material.
2. If the measured current exceeds the rated current, magnetic core saturation will occur and the output voltage signal will not be linearly proportional to the measured current.

<Closed Loop>

1. For closed loop current sensors please insure the power supply voltage is balanced, symmetrical, and, applied simultaneously to avoid potential increase in DC offset error.
2. Maximum rated current measurement duration is timedependent. Maximum rated current applied in excess of the time limit can result in damage to internal electronic circuitry; please consult Tamura for assistance.
3. When using a measurement resistor to convert current output to voltage output select a resistor with stable temperature characteristic to insure accuracy of the output voltage.
4. Compensation current supplied to the secondary winding varies in proportion to the measured current based on the conversion ratio. (If/KN; KN = secondary turns) Please insure the PSU has required current capacity to supply compensation current to the secondary winding.

<Flux-Gate>

1. Compensation current supplied to the secondary winding varies in proportion to the measured current. Please insure the PSU has required current capacity to supply compensation current to the secondary winding.
2. There is 450kHz ripple voltage present on the output and reference output voltage signals . An external capacitor maybe added if necessary.

Important Notice

1. The content of this information is subject to change without prior notice for the purpose of improvements, etc. Ensure that you are in possession of the most up-to-date information when using this product.

2. This product is intended to be used in general electronics applications (electric home appliances, business equipment, information equipment, communication terminal equipment, measuring devices, industrial equipment, and so on). This product is neither intended nor warranted for use in following equipment or devices:

   Special application (such as for medical devices, transportation equipment, traffic signal control equipment, fire and crime prevention equipment, aeronautics and space devices, nuclear power control, fuel control, in-vehicle equipment, safety devices, and so on) in which extremely high quality and high reliability is required, or if the malfunction or failures of product could be cause loss of human life, bodily injury.

   Tamura Corporation shall not be held responsible for any damage incurred by customers or any third party when products are used in special application, unless specifically permitted in this document.

3. Tamura Corporation constantly strives to improve quality and reliability, but malfunction or failures are bound to occur with some probability in current sensor. To ensure that failures do not cause accidents resulting in injury or death, fire accidents, social damage, and so on, users are to thoroughly verify the safety of their designs in devices and/or systems.

4. The operation examples and circuit examples shown in this information are for reference purposes only, and Tamura Corporation disclaims all responsibility for any violations of industrial property rights, intellectual property rights and any other rights owned by Tamura Corporation or third parties that these may entail.

5. The circuit examples and part constants listed in these specifications are provided as reference for the verification of characteristics. The user is to perform design, verification, and judgment under his or her own responsibility, taking into account the various conditions.

6. The products are designed for use in environments where consumer electronics are commonly used. It is not designed for use in special environments such as listed below, and if such use is considered, the user is to perform thorough safety and reliability checks under his/her responsibility.

7. This product is not designed to resist radiation.
   - *Use in liquids such as water, oil, chemical solutions, or organic solvents, and use in locations where the product will be exposed to such liquids.*
   - *Use that involves exposure to direct sunlight, outdoor exposure, or dusty conditions.*
   - *Use in locations where corrosive gases such as sea winds, Cl2, H2S, NH3, SO2, or NO2, are present. (Some product improves durability)*
   - *Use in environments with strong static electricity or electromagnetic radiation.*
   - *Use that involves placing inflammable material next to the product.*
   - *Use of this product either sealed with a resin filling or coated with resin.*
   - *Use of water or a water soluble detergent for flux cleaning.*
   - *Use in locations where condensation is liable to occur.*

8. Do not use or otherwise make available the TAMURA products or the technology described in this document for any military purposes, including without limitation, for the design, development, use, stockpiling or manufacturing of mass destruction weapons (e.g. nuclear, chemical, or biological weapons or missile technology products). When exporting and re-exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations including, without limitation, Japan -Foreign Exchange and Foreign Trade Control Law and U.S.-Export Administration Regulations. The TAMURA products and related technology should not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.

9. Please contact your TAMURA sales office for details as to environmental matters such as the RoHS compatibility of Product. Please use TAMURA products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. TAMURA assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.

10. TAMURA assumes no liability for damages or losses incurred by you or third parties as a result of unauthorized use of TAMURA products.

11. This document and any information herein may not be reproduced in whole or in part without prior written permission from TAMURA.

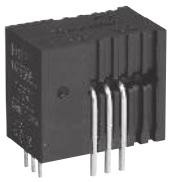
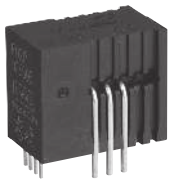
Fluxgate system / Voltage-output type, Anti-Surge current, Compact

F01P S05L, F02P S05L, F03P S05L SERIES





F01PxxxS05L **F02PxxxS05L** **F03PxxxS05L**

- Backward compatible to F01PxxxS05, F02PxxxS05, F03PxxxS05 Series.
- Anti-Surge current (4kAT, 8/20uS, single)
- Mounting area reduced, however, pin compatibility. Longitudinal dimension reduced.
- Super precision & High stability (Low temperature drift) .
- Unipolar power voltage; +5V. Rated Current; 6 ~ 50A. Multi-range models. MAX_Temp.105℃ . Voltage-output type.
- F01PxxxS05L series are designed by the pin compatibility as high-end models of S22PxxxS05M2 series.

Comparison of the main features

Series	Features
F01PxxxS05L	Without reference access.
F02PxxxS05L	With reference access, Ref_in / Ref_out.
F03PxxxS05L	With reference access, Ref_in / Ref_out. Higher creepage and clearance distances.

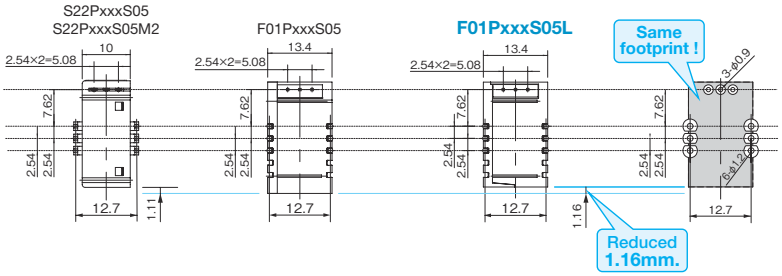
***: Rated Current symbol

SPECIFICATIONS

Spec \ Types	Value		
	F01PxxxS05L	F02PxxxS05L	F03PxxxS05L
Maximum peak current	4kAT (2kA × 2. Number of primary tunes is two tunes.)		
Rated Current If (xxx: Rated Current symbol)	6A (006) / 15A (015) / 25A (025) / 50A (050)		
Maximum current (At Vcc=+5V, Ta=+105℃)	± 20A (If=6A) / ± 51A (If=15A) / ± 85A (If=25A) / ± 150A (If=50A)		
Existence of reference access	No	Yes	
Number of primary busbar	3pcs		4pcs
Clearance distance, Primary ⇔ Secondary	7.7mm	7.5mm	8.2mm
STANDARDS	UL508 (file No. E243511), EN50178, EN61010-1, EN60950-1		
Ambient operating temperature	− 40℃ ~ +105℃		

Mounting area

The mounting area has been reduced more than the F01P / F02P / F03PxxxS05 series. However, the F01P / F02P / F03PxxxS05L series series are 100% compatible with the F01P / F02P / F03PxxxS05series in regards to the footprint mounting.



The F02P/F03PxxxS05L series also similarly reduces the mounting area.

The above-mentioned comparison tables are the auxiliary data for understanding each series. For details, please confirm the next page or subsequent ones. ▶▶▶

Reference voltage

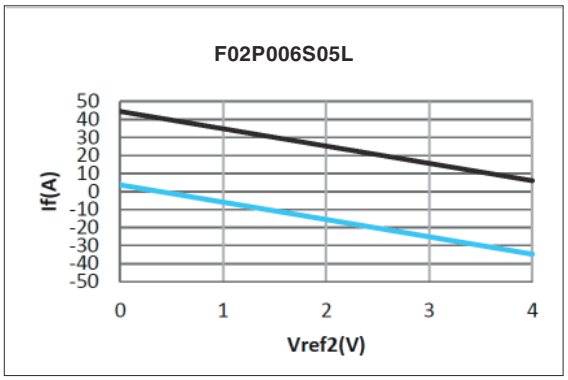
The Ref pin has two modes Ref IN and Ref OUT :

＜Ref OUT mode＞
The 2.5V internal precision reference is used by the transducer as the reference point for bipolar measurements;

＜Ref IN mode＞
An external reference voltage is connected to the Ref pin; this voltage is specified in the range 0 to 4 V ,
its voltage is used as the reference voltage at the time of measurement.

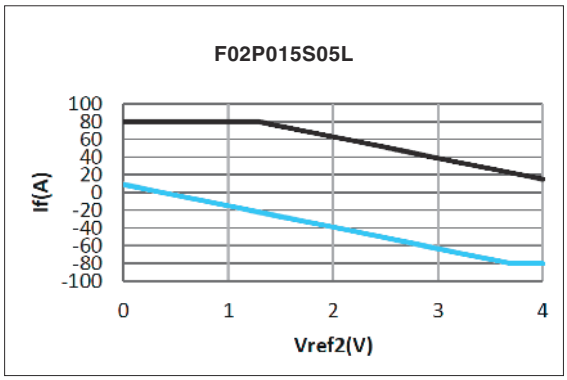
- either to source a typical current of (Vref − 2.5) /680,the maximum value will be 2.2mA typ.when Vref2 = 4V.
- or to sink a typical current of (2.5 − Vref2) /680,the maximum value will be 3.68mA typ.when Vref2 = 0V.

The following graphs show how the measuring range of each transducer version depends on external reference voltage value Vref2.

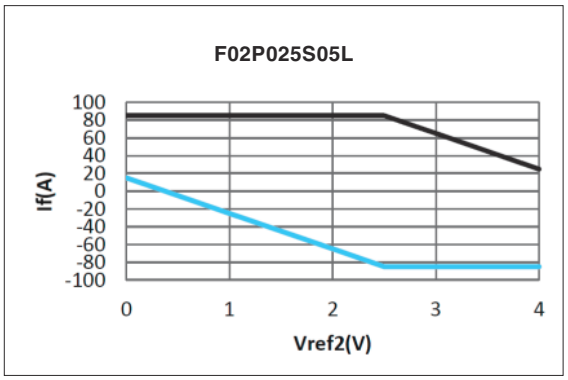


Upper limit : Ip = − 9.6 × Vref2 + 44.4 (Vref2 = 0...4V)

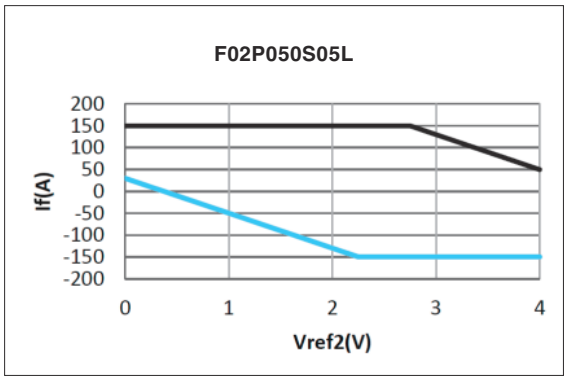
Lower limit : Ip = − 9.6 × Vref2 + 3.6 (Vref2 = 0...4V)



Upper limit : Ip = 80 (Vref2 = 0...1.29V)
Ip = − 24 × Vref2 + 111 (Vref2 = 1.29...4V)
Lower limit : Ip = − 24 × Vref2 + 9 (Vref2 = 0...3.7V)
Ip = − 80 (Vref2 = 3.7...4V)



Upper limit : Ip = 85 (Vref2 = 0...2.5V)
Ip = − 40 × Vref2 + 185 (Vref2 = 2.5...4V)
Lower limit : Ip = − 40 × Vref2 + 15 (Vref2 = 0...2.5V)
Ip = − 85 (Vref2 = 2.5...4V)



Upper limit : Ip = 150 (Vref2 = 0...2.75V)
Ip = − 80 × Vref2 + 370 (Vref2 = 2.75...4V)
Lower limit : Ip = − 80 × Vref2 + 30 (Vref2 = 0...2.25V)
Ip = − 150 (Vref2 = 2.25...4V)

If you do not want to use the Ref pin, please unconnected.

Reference voltage

The Ref pin has two modes Ref IN and Ref OUT :

＜Ref OUT mode＞
The 2.5V internal precision reference is used by the transducer as the reference point for bipolar measurements;

＜Ref IN mode＞
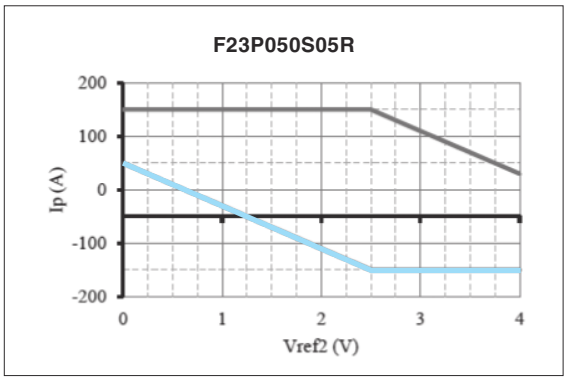
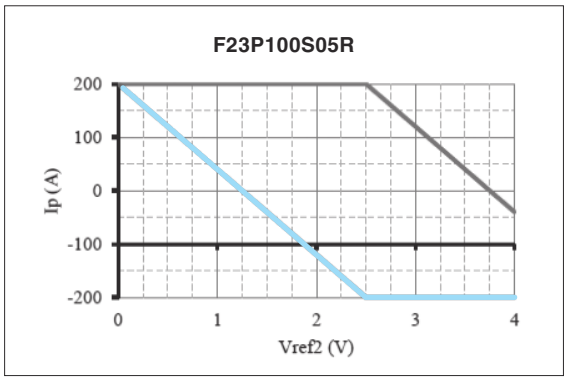
An external reference voltage is connected to the Ref pin; this voltage is specified in the range 0 to 4 V , its voltage is used as the reference voltage at the time of measurement.

-either to source a typical current of (Vref − 2.5) /680,the maximum value will be 2.2mA typ.when Vref2 = 4V.
-or to sink a typical current of (2.5 − Vref2) /680,the maximum value will be 3.68mA typ.when Vref2 = 0V.

The following graphs show how the measuring range of each transducer version depends on external reference voltage value Vref2.



Upper limit : Ip = 150 (Vref2 = 0...2.5V)
Ip = − 80 × Vref2 + 350 (Vref2 = 2.5...4V)
Lower limit : Ip = − 80 × Vref2 + 50 (Vref2 = 0...2.5V)
Ip = − 150 (Vref2 = 2.5...4V)



Upper limit : Ip = 200 (Vref2 = 0...2.5V)
Ip = − 160 × Vref2 + 600 (Vref2 = 2.5...4V)
Lower limit : Ip = − 160 × Vref2 + 200 (Vref2 = 0...2.5V)
Ip = − 200 (Vref2 = 2.5...4V)

If you do not want to use the Ref pin, please unconnected.

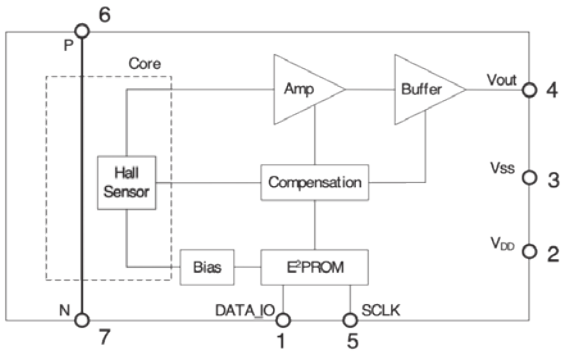
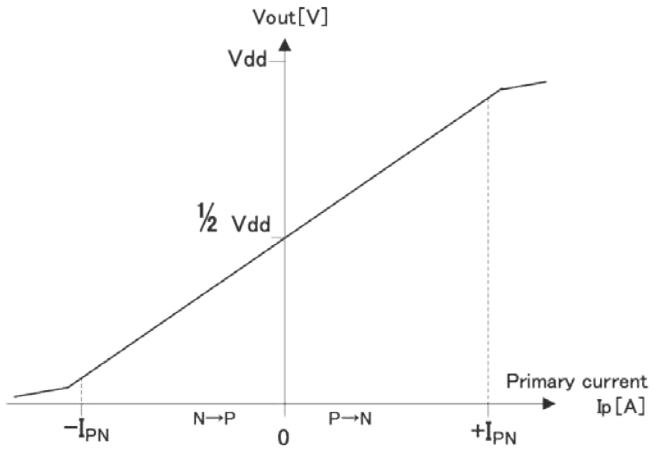
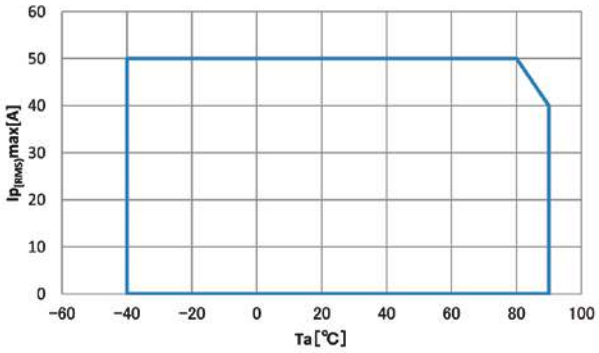
FUNCTIONAL BLOCK DIAGRAM



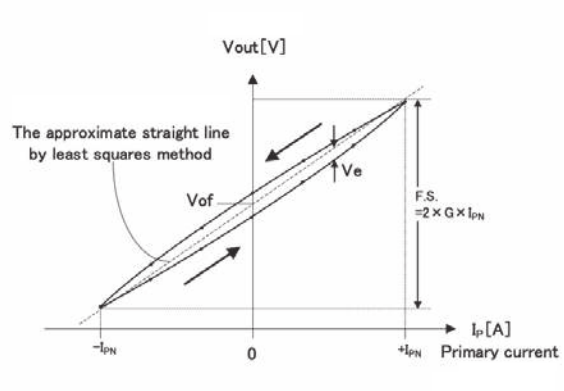
CHARACTERISTIC CURVE (TYP) AND PRIMARY CURRENT DERATING CURVE





Conditions : Mounted on the test board complying with the EIA/JEDEC Standards (EIA/JESD51.)

CHARACTERISTICS DEFINITIONS



・Sensitivity G[mV/A],Offset voltage Vof[V]
Sensitivity (G) is defined as slope of the approximate straight line by least squares method, using the data of the output voltage (Vout) when sweeping the measured current Ip at rated current range.
Also Offset voltage (Vof) is defined as the intercept of the approximate straight line.

・Output linearity ε_L[%]
Output linearity (ε_L) is defined as the ratio of maximum error voltage (Ve) to the full scale (F.S.) , where Vd is maximum difference between the Output voltage (Vout) and the approximate straight line calculated in the sensitivity and offset voltage definition;
ε_L=Ve／F.S.×100

・Ratiometric error of sensitivity $V_{G\text{-}R}$[%],ratiometric error of Offset voltage $Vof_{\text{-}R}$[%]
Output of LA01M Series is ratiometric.
Sensitivity(G) and Offset voltage(Vof) are proportional to Supply voltage (V_{DD}).

・Ratiometric error is defined as follows in the supply voltage range (4.5V<V_{DD}1<5.5V);
$V_{G\text{-}R}$ =100×[(G(V_{DD}=V_{DD}1)／G(V_{DD}=5V))−(V_{DD}1／5)]／(V_{DD}1／5)
$Vof_{\text{-}R}$ =100×[Vof(V_{DD}=V_{DD}1)−Vof(V_{DD}=5V)×(V_{DD}1／5)]／F.S.

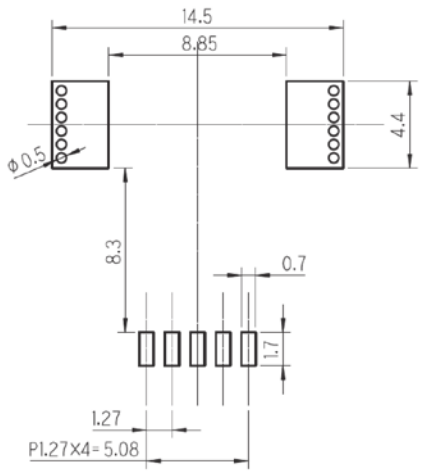
Plating for Terminals : Sn (100%)
Package : RoHS compliant, halogen free

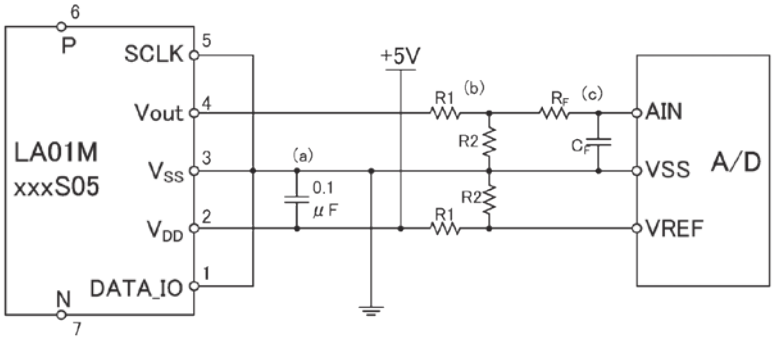
Note1) The tolerances of dimensions without any mention are ± 0.1mm.
Note2) The adhesive material (RoHS compliant, halogen free) is used for holding the magnetic core.

RECOMMENDED THROUGH-HOLE LAYOUTS (mm)



Note) If 2 or more trace layers are used as the current path, please make enough number of through-holes to flow current between the trace layers.

TYPICAL APPLICATION



(a) Please be placed the bypass capacitor 0.1 μF as close as possible to the VDD and VSS pins of LA01M Series.
(b) LA01M Series have a ratiometric output. When received output by the A / D converter , it is possible to reduce the A / D conversion error due to supply voltage fluctuations by setting a common voltage level of the A / D converter and supply voltage. The resistive divider with R1 and R2 is required, if the reference voltage of the A / D converter is lower than + 5V.
(c) If necessary, please insert a low-pass filter to Vout.

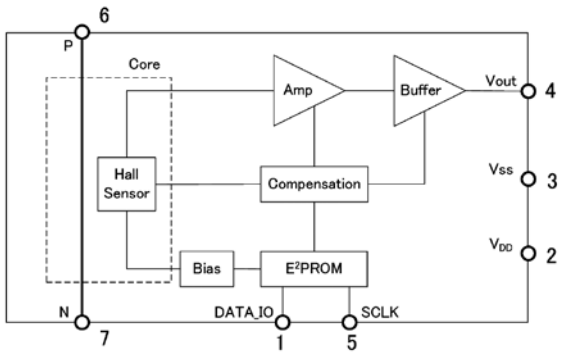
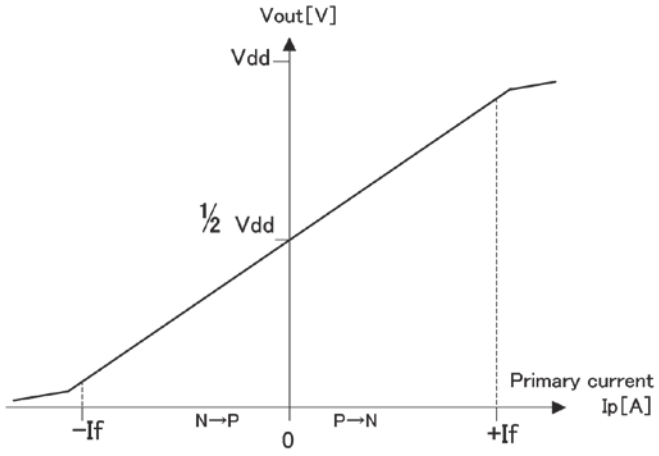
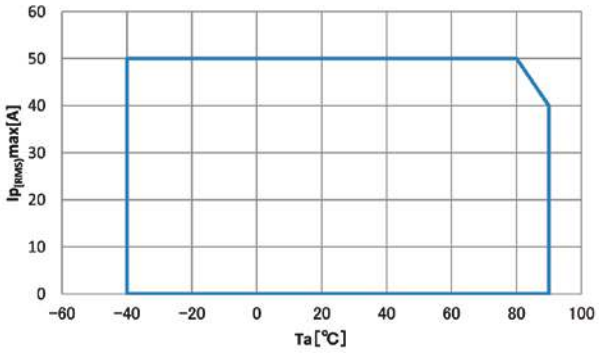
FUNCTIONAL BLOCK DIAGRAM



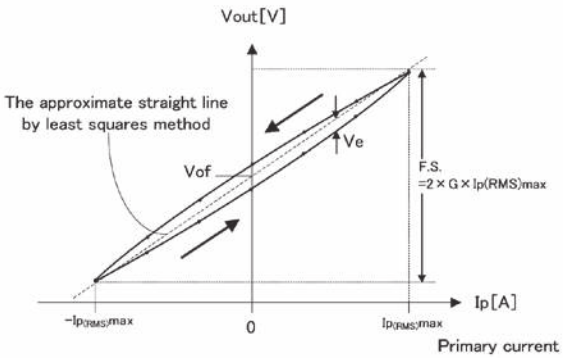
CHARACTERISTIC CURVE (TYP) AND PRIMARY CURRENT DERATING CURVE





Conditions : Mounted on the test board complying with the EIA/JEDEC Standards (EIA/JESD51.)

CHARACTERISTICS DEFINITIONS



・When $Ip_{(RMS)}max$ is bigger than the value of If, $Ip_{(RMS)}max$ restricts it to the value of If.

・Sensitivity G[mV/A],Offset voltage Vof[V]
Sensitivity(G)is defined as slope of the approximate straight line by least squares method, using the data of the output voltage(Vout)when sweeping the measured current Ip at rated current range.
Also Offset voltage(Vof)is defined as the intercept of the approximate straight line.

・Output linearity ε_L[%]
Output linearity(ε_L)is defined as the ratio of maximum error voltage(Ve)to the full scale(F.S.) , where Vd is maximum difference between the Output voltage(Vout)and the approximate straight line calculated in the sensitivity and offset voltage definition;
ε_L=Ve／F.S.×100

・Ratiometric error of sensitivity $V_{G\text{-}R}$[%],ratiometric error of Offset voltage $Vof_{\text{-}R}$[%]
Output of LA01P Series is ratiometric.
Sensitivity(G)and Offset voltage(Vof)are proportional to Supply voltage (V_{DD}).

・Ratiometric error is defined as follows in the supply voltage range (4.5V<V_{DD}1<5.5V);
$V_{G\text{-}R}$ =100×[(G(V_{DD}=V_{DD}1)／G(V_{DD}=5V))−(V_{DD}1／5)]／(V_{DD}1／5)
$Vof_{\text{-}R}$ =100×[Vof(V_{DD}=V_{DD}1)−Vof(V_{DD}=5V)×(V_{DD}1／5)]／F.S.

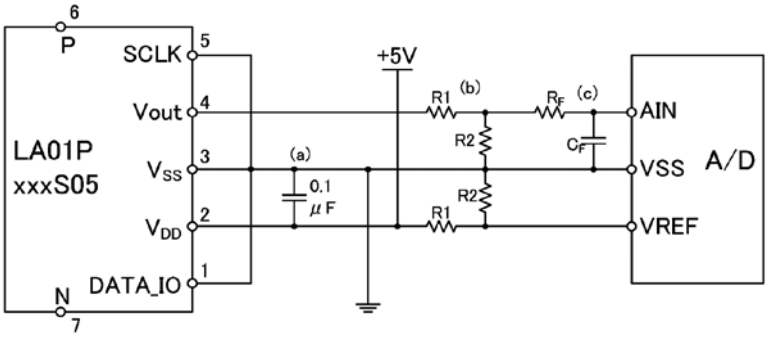
TYPICAL APPLICATION



(a) Please be placed the bypass capacitor 0.1 μF as close as possible to the V_{DD} and V_{SS} pins of LA01P Series.
(b) LA01P Series have a ratiometric output. When received output by the A / D converter , it is possible to reduce the A / D conversion error due to supply voltage fluctuations by setting a common voltage level of the A / D converter and supply voltage. The resistive divider with R1 and R2 is required, if the reference voltage of the A / D converter is lower than + 5V.
(c) If necessary, please insert a low-pass filter to Vout.

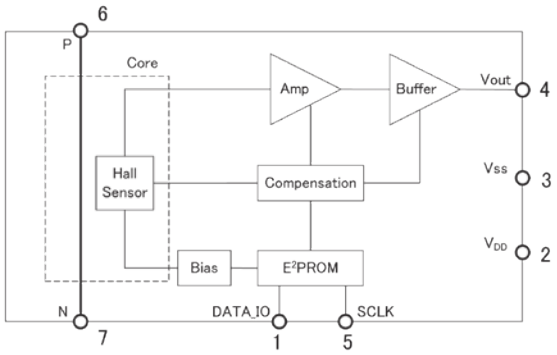
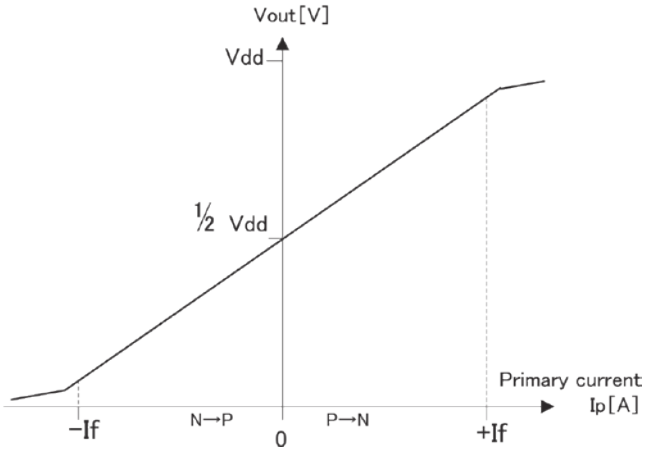
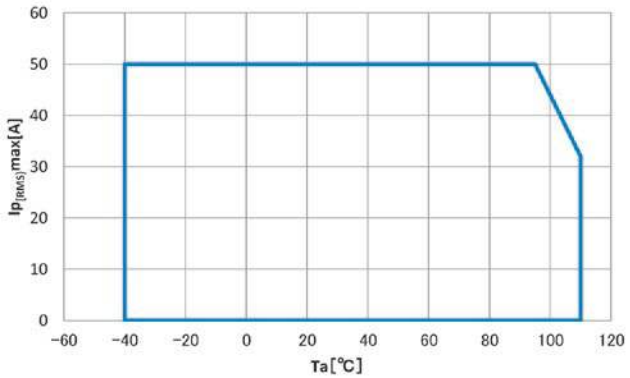
FUNCTIONAL BLOCK DIAGRAM



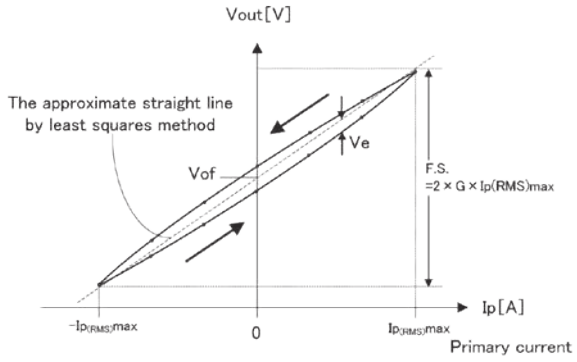
CHARACTERISTIC CURVE (TYP) AND PRIMARY CURRENT DERATING CURVE





Conditions : Mounted on the test board complying with the EIA/JEDEC Standards (EIA/JESD51.)

CHARACTERISTICS DEFINITIONS



・Sensitivity G[mV/A],Offset voltage Vof[V]
Sensitivity (G) is defined as slope of the approximate straight line by least squares method, using the data of the output voltage (Vout) when sweeping the measured current Ip at rated current range.
Also Offset voltage (Vof) is defined as the intercept of the approximate straight line.

・Output linearity ε_L[%]
Output linearity(ε_L) is defined as the ratio of maximum error voltage (Ve) to the full scale(F.S.) , where Vd is maximum difference between the Output voltage (Vout) and the approximate straight line calculated in the sensitivity and offset voltage definition;

$$\varepsilon_L = Ve / F.S. \times 100$$

・Ratiometric error of sensitivity $V_{G\text{-}R}$[%],ratiometric error of Offset voltage $Vof_{\text{-}R}$[%]
Output of LA04P Series is ratiometric.
Sensitivity(G) and Offset voltage(Vof) are proportional to Supply voltage (V_{DD}).
Ratiometric error is defined as follows in the supply voltage range ($4.5V < V_{DD}1 < 5.5V$);

$$V_{G\text{-}R} = 100 \times [(G(V_{DD}=V_{DD}1) / G(V_{DD}=5V)) - (V_{DD}1 / 5)] / (V_{DD}1 / 5)$$

$$Vof_{\text{-}R} = 100 \times [Vof(V_{DD}=V_{DD}1) - Vof(V_{DD}=5V) \times (V_{DD}1 / 5)] / F.S.$$

*F.S. =2×G×Ip(RMS)max

RELIABILITY TEST

No.	Item	Test Conditions	n	Test Time
1	High Temp. High Humiditv Bias Test	【JEITA EIAJ ED-4701 102】 Ta=85℃, 85%RH, continuous operation	22	1000h
2	High Temperature Bias Test	【JEITA EIAJ ED-4701 101】 Ta=125℃,continuous operation	22	1000h
3	High Temperature Storage Test	【JEITA EIAJ ED-4701 201】 Ta=150℃	22	1000h
4	Low Temperature Storage Test	【JEITA EIAJ ED-4701 202】 Ta=-55℃	22	1000h
5	Heat Cycle Test	【JEITA EIAJ ED-4701 105】 -65℃(30min) ⇔ 150℃(30min) Tested in vapor phase	22	500 cycles
6	Vibration Test	【JEITA EIAJ ED-4701 403】 Vibration frequency: 10~55Hz(1 min.) Vibration amplitude: 1.5mm(x,y,z directions)	5	2h for each direction

Tested samples are pretreated as below before each reliability test:
Desiccation : 125℃ /24h → Moisture Absorption : 85℃ /85%RH/168h → Flow : 1 time (260℃ , 10s)

Criterion for determining
Products whose drifts before and after the reliability tests do not exceed the values below are considered to be in spec.
Sensitivity G (Ta=25℃) : Within ± 1.5% (All model)
Offset Voltage Vof (Ta=25℃) : Within ± 150mV (LA03P021S05), Within ± 100mV (Other model)
Output Linearity ε_L (Ta=25℃) : Within ± 1% (All model)

Servo system / Voltage-output type External magnetic field improvement type

ABSOLUTE MAXIMUM RATINGS

Parameters	Symbol	Unit	Value	Remarks
Maximum Supply voltage	Vcc	V	± 25.2	
Primary conductor temperture	T_B	℃	100	

ISOLATION CHARACTERISTICS

Parameters		Symbol	Unit	Value	Remarks
Insulation voltage		Vd	kVrms	AC6700V, for 1minute (Sensing current 0.5mA)	Primary ⇔ Secondary
Impulse withstand voltage		Vw	kV	23	Primary ⇔ Secondary Input waveform : ・Front time 1.2μs ・Time to half value 50μs ・single
Insulation resistance		R_{IS}	—	≧ 500M Ω (at DC500V)	Primary ⇔ Secondary
Clearance distance		d_{Cl}	—	min : 12.1 (min : 30.4)	Primary ⇔ Secondary (Busbar ⇔ ConnectorPWB)
Creepage distance		d_{Cp}	—	min : 35.5 (min : 33.0)	Primary ⇔ Secondary (Busbar ⇔ ConnectorPIN)
Case material		—	—	UL94 V-0	
Filler material		—	—	UL94 V-0	
Comparative Tracking Index ; (CTI)	Case	CTI	V	400 ～ 599 (Group II)	
	Filler	CTI	V	600 (Group I)	
Application example		—	—	2.475kVa.c ,CAT Ⅲ , PD2	Reinforced isolation, non uniform field according to EN50178 : 1997
		—	—	1kVa.c 1.5kVd.c ,CAT Ⅲ , PD2	Reinforced isolation, non uniform field according to EN62477-1 : 2012 and EN62477-1 : 2012/A11 2014

ENVIRONMENTAL AND MECHANICAL CHARACTERISTICS

Parameters	Symbol	Unit	Value			Remarks
			MIN	TYP	MAX	
Ambient operating temperature	T_A	℃	− 40	—	+ 85	
Ambient storage temperature	T_S	℃	− 40	—	+ 90	
Mass	m	kg	—	1.3	—	

SPECIFICATIONS

T_A=+25℃, R_M=1Ω, Vcc=±24V

Parameters	Symbol	Unit	Value			Remarks
			MIN	TYP	MAX	
Primary nominal current	I_{PN}	A	—	2000	—	
Primary current, measuring range ＊1,2	I_{PM}	A	3500	—	—	at Ta=+85℃ ,Vcc= ± 22.8Vmin, RM=1ohm, t=2sec
Measuring resistance ＊1	R_M	Ω	0	—	—	See Fig1
Conversion ratio	K_N	—	—	1 : 5000	—	
Output current @I_{PN}	Io	mA	—	400	—	Io = I_{PN} /5000. Without Iof.
Accuracy @I_{PN}	X	%	− 0.2	0.0	+ 0.2	T_A=25℃～ 85℃ , Without Iof.
			− 0.3	0.0	+ 0.3	T_A= − 40℃～ 85℃ , Without Iof.
Offset current ＊3	Iof	mA	− 0.2	0.0	+ 0.2	at I_P = 0A.
Linearity error （0A ～ I_{PN}）	ε_L	%	− 0.1	0.0	+ 0.1

Supply voltage	Vcc	V	± 15 （± 5%）	± 24 （± 5%）		
Consumption current	Icc	mA	—	45	—	at Ip= 0A. Icc = 45 + Ip /5000.
Response time @90% of I_{PN} ＊4	t_r	μs	—	0.5	—	di/dt=100A/μs
Frequency bandwidth （− 3dB） ＊5	BW	kHz	—	150	—	See Fig2, at very low current
Temperature coefficient of Iof ＊3	Tclof	μA/℃	− 4.8	0	+ 4.8	at Ip= 0A
Secondary coil resistance	Rs	Ω	—	—	24.5	T_A = + 85℃

＊1 Current sensor has limited operating time depending on the measured resistance and maximum current.
Internal circuits can become corrupted if you used beyond the limited time.
＊2 The value of measured current which indicates an output with a greater than ± 5% deviation from the theoretical output value.
＊3 Offset current is measured after removal of the hysteresis.
＊4 Measurement condition : Primary conductor cross sectional area is as same as through hole, and penetration with 1turn in through hole.
＊5 High fundamental frequency primary current and/or harmonic current may result in excessive heating in magnetic core (Silicon steel).

STANDARDS

EN50178:1997, EN62477-1：2012 and EN62477-1：2012/A11 2014, UL508（No.E243511）, CSA22.2 No.14-13
