4-Pin Microprocessor Power Supply Supervisors with Manual Reset

FEATURES

- **Precision monitoring of**
  +5.0 V (± 5%, ± 10%, ± 20%),
  +3.3 V (± 5%, ± 10%),
  +3.0 V (± 10%) and
  +2.5 V (± 5%) power supplies
- **Manual reset input**
- **Offered in two output configurations:**
- **CAT811: Active LOW reset**
- **CAT812: Active HIGH reset**
- **Direct replacements for the MAX811 and MAX812 in applications operating over the industrial temperature range**
- **Reset valid down to V_{CC} = 1.0V**
- **6µA power supply current**
- **Power supply transient immunity**
- **Available in SOT-143 packages with Sn or NiPdAu Green Lead finishes.**
- **Industrial temperature range: -40ºC to +85ºC**

APPLICATION

- **Computers, Servers, Laptops**
- **Cable modems**
- **Wireless communications**
- **Embedded control systems**
- **White goods**
- **Power meters**
- **Intelligent instruments**
- **PDAs and handheld equipment**

DESCRIPTION

The CAT811 and CAT812 are microprocessor supervisory circuits that monitor power supplies. The CAT811 and CAT812 are direct replacements for the MAX811 and MAX812 in applications operating over the industrial temperature range; both have a manual reset input.

These devices generate a reset signal, which is asserted while the power supply voltage is below a preset threshold level and for at least 140ms after the power supply level has risen above that level. The underlying floating gate technology, $AE^{2(TM)}$ used by Catalyst Semiconductor, makes it possible to offer any custom reset threshold value. Seven industry standard threshold levels are offered to support +5.0V, +3.3V, +3.0V and +2.5V systems.
The CAT811 features a RESET push-pull output (active LOW) and the CAT812 features a RESET push-pull output (active HIGH).

Fast transients on the power supply are ignored and the output is guaranteed to be in the correct state at Vcc levels as low as 1.0 V.

The CAT811/812 are fully specified over the industrial temperature range (-40°C to 85°C) and are available in a compact 4-pin SOT-143 package.

PIN CONFIGURATION

PIN DESCRIPTION

Pin Number		Name	Description
CAT811	**CAT812**		
1	1	GND	Ground
2	—	$\overline{\text{RESET}}$	Active LOW reset. $\overline{\text{RESET}}$ is asserted if V_{CC} falls below the reset threshold and remains low for at least 140ms after V_{CC} rises above the reset threshold.
—	2	RESET	Active HIGH reset. RESET is asserted if V_{CC} falls below the reset threshold and remains high for at least 140ms after V_{CC} rises above the reset threshold.
3	3	$\overline{\text{MR}}$	Manual Reset Input. A logic LOW on $\overline{\text{MR}}$ asserts RESET. RESET remains active as long as $\overline{\text{MR}}$ is LOW and for 140ms after $\overline{\text{MR}}$ returns HIGH. The active low input has an internal 20kΩ pull-up resistor. The input should be left open if not used.
4	4	V_{CC}	Power supply voltage that is monitored.

Notes:

(1) Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions outside of those listed in the operational sections of this specification is not implied. Exposure to any absolute maximum rating for extended periods may affect device performance and reliability.

DETAILED DESCRIPTION

RESET TIMING

The reset signal is asserted LOW for the CAT811 and HIGH for the CAT812 when the power supply voltage falls below the threshold trip voltage and remains asserted for at least 140ms after the power supply voltage has risen above the threshold.
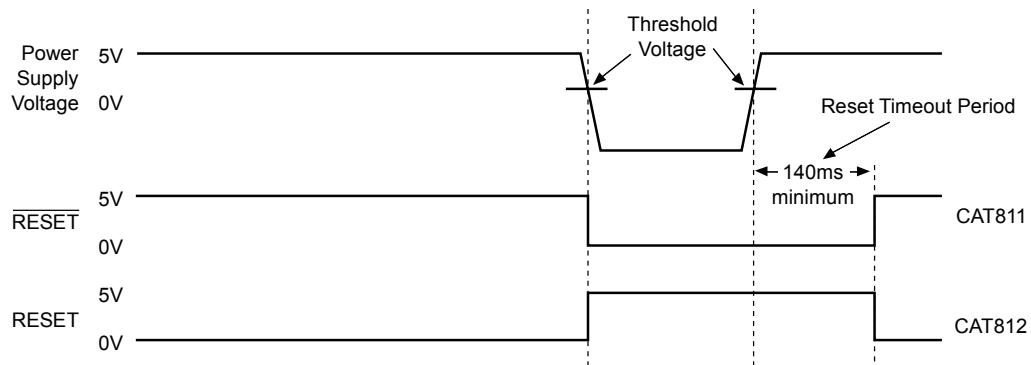

Figure 1. Reset Timing Diagram

V_{CC} TRANSIENT RESPONSE

The CAT811/812 protect µPs against brownout failure. Short duration transients of 4µs or less and 100mV amplitude typically do not cause a false RESET.

Figure 2 shows the maximum pulse duration of negative-going V_{CC} transients that do not cause a reset condition.

As the amplitude of the transient goes further below the threshold (increasing $V_{TH} - V_{CC}$), the maximum pulse duration decreases. In this test, the V_{CC} starts from an initial voltage of 0.5V above the threshold and drops below it by the amplitude of the overdrive voltage ($V_{TH} - V_{CC}$).
Figure 2. Maximum Transient Duration without Causing a Reset Pulse vs. Reset Comparator Overdrive

VALID RESET WITH V$_{CC}$ UNDER 1.0V

To ensure that the CAT811 $\overline{\text{RESET}}$ pin is in a known state when V$_{CC}$ is under 1.0V, a 100kΩ pull-down resistor between $\overline{\text{RESET}}$ pin and GND is recommended; the value is not critical. For the CAT812, a pull-up resistor from RESET pin to V$_{CC}$ is needed.
**Figure 3. $\overline{\text{RESET}}$ Valid with V$_{CC}$ under 1.0V**

Figure 4. RESET Valid with V$_{CC}$ under 1.1V

BI-DIRECTIONAL RESET PIN INTERFACING

The CAT811/812 can interface with µP/µC bi-directional reset pins by connecting a 4.7kΩ resistor in series with the CAT811/812 reset output and the µP/µC bi-directional reset pin.
