

# LDX-D50

## 50A DIN Rail Active Redundancy (ORing) Module

LDX-D50 is a modern, CPU controlled device and responds to a wide range of applications where strong redundancy of DC power supplies is needed.

By keeping the two power supplies (PS) “hot” (each operating at half of the load need) the system reaches higher MTBF than by using one PS “hot” and the other “cold” (as per standard ORing devices). It allows same life expectancy for the electrolytic capacitors and other sensitive parts of both PS and it prevents an excessive ageing of the unit that should be kept “hot”.

LDX-D50 allows the paralleling of the output of any two identical PS with any current up to 50 A and voltages from 12 V to 85 V. The isolation between the units is achieved through power MOSFETs with advanced control circuitry.

Several LDX-D50 can be interconnected in order to achieve redundancy for > 2 PS systems. LDX-D50 allows perfect current distribution between two PS, in case of their use for shared power.

LDX-D50 provides perfect isolation between two PS in case of one unit failure and also the continuous delivery of energy towards a critical load. It is specially designed for high MTBF and compliance to a wide choice of PS and loads.

**Notes:**

Technical parameters are typical, measured in laboratory environment at 25°C and 24 VDC, at nominal values, after minimum 5 minutes of operation. Power rating, losses, efficiency, ripple, thermal behaviour and start-up may change outside of the nominal rated input range. Contact factory for details.
