# **BUFFER/CLOCK DRIVER**

#### DATASHEET

#### MK3805

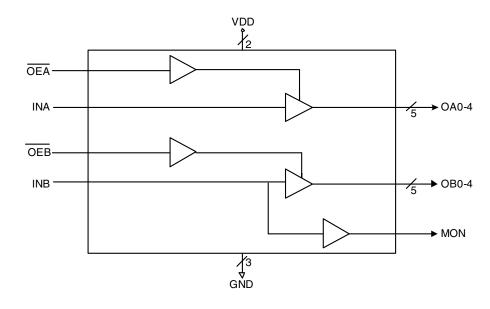

#### Description

The MK3805 is a non-inverting clock driver/buffer providing two independent banks of four outputs each. These buffers have a tri-state output enable input (active low) with 1-input, 5-output configuration per group. The skew between the outputs of the same package is 0.5 ns and the skew between the outputs of different packages is 0.8 ns. The maximum input to output delay is 4.5 ns.

#### **Features**

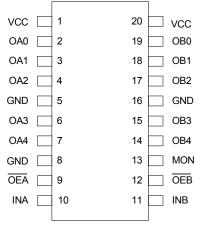

- Packaged in 20-pin SSOP
- · Available in Pb (lead) free package
- · Five outputs for each bank with one clock input
- Two separate banks of five outputs each
- Advanced, low-power, CMOS process
- · Ten output clocks
- Two separate inputs
- Industrial temperature range -40° C to +85° C
- Hysteresis on all inputs

#### *NOTE: EOL for non-green parts to occur on 5/13/10 per PDN U-09-01*

| 16            | GND         | Power       | Connect to ground.                          |  |
| 17            | OB2         | Output      | Clock output.                               |  |
| 18            | OB1         | Output      | Clock output.                               |  |
| 19            | OB0         | Output      | Clock output.                               |  |
| 20            | VCC         | Power       | Connect to +3.3 V.                          |  |

## **External Components**

The MK3805 requires a minimum number of external components for proper operation.

#### **Decoupling Capacitors**

Decoupling capacitors of  $0.01\mu$ F must be connected between VDD and GND, as close to these pins as possible. For optimum device performance, the decoupling capacitors should be mounted on the component side of the PCB. Avoid the use of vias in the decoupling circuit.

#### **Series Termination Resistor**

When the PCB trace between the clock outputs and the loads are over 1 inch, series termination should be used. To series terminate a  $50\Omega$  trace (a commonly used trace impedance) place a  $33\Omega$  resistor in series with the clock line, as close to the clock output pin as possible. The nominal impedance of the clock output is  $20\Omega$ 

## **PCB Layout Recommendations**

For optimum device performance and lowest output phase noise, the following guidelines should be observed.

1) The  $0.01\mu$ F decoupling capacitors should be mounted on the component side of the board as close to the VDD pins as possible. No vias should be used between the decoupling capacitors and VDD pins. The PCB trace to VDD pin should be kept as short as possible, as should the PCB trace to the ground via.

2) To minimize EMI, the  $33\Omega$  series termination resistor (if needed) should be placed close to the clock output.

3) An optimum layout is one with all components on the same side of the board, minimizing vias through the signal layers. Other signal traces should be routed away from the MK3805. This includes signal traces just underneath the device, or on layers adjacent to the ground plane layer used by the device.

### **Absolute Maximum Ratings**

Stresses above the ratings listed below can cause permanent damage to the MK3805. These ratings, which are standard values for IDT commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

| Item                          | Rating              |
|-------------------------------|---------------------|
| Supply Voltage, VDD           | 7 V                 |
| All Inputs and Outputs        | -0.5 V to VDD+0.5 V |
| Ambient Operating Temperature | -40 to +85° C       |
| Storage Temperature           | -65 to +150° C      |
| Junction Temperature          | 125°C               |
| Soldering Temperature         | 260° C              |

# **Recommended Operation Conditions**

| Parameter   | Min.  | Тур. | Max.  | Units |
|---|-------|------|-------|-------|
| Ambient Operating Temperature                     | -40   |      | +85   | °C    |
| Power Supply Voltage (measured in respect to GND) | +3.13 | +3.3 | +3.46 | V     |

## **DC Electrical Characteristics**

Unless stated otherwise, VDD = 3.3 V ±5%, Ambient Temperature -40° C to +85° C
