

## DESCRIPTION

The EV3391EY-00A is an evaluation board for the MP3391EY, a step-up converter designed for large liquid-crystal displays that employ an array of LEDs as the light source. It can drive up to 8 WLED strings in parallel with 80mA maximum current.

The MP3391 uses external power MOSFET and internal current mode, fixed frequency architecture and includes current ballast in each string terminal, which achieves 2.5% current regulation accuracy between strings. Low feedback voltage at each LED string help reduce power loss and improve efficiency.

The MP3391 is flexible for extending LED channels with two or more MP3391s in parallel.

The MP3391 has multiple features to protect the converter from fault conditions, including under-voltage lockout, current limiting, over voltage, short LED, open LED and thermal shut-down protection.

## ELECTRICAL SPECIFICATIONS

Parameter	Symbol	Value	Units
Input Voltage	$V_{IN}$	10 – 28	V
LEDs #		8 strings parallel and 12 LEDs/string	
LED Current	$I_{LED}$	60/string	mA

## FEATURES

- 10V to 28V Input Voltage Range
- External Power MOSFET
- Up to 90% Efficiency
- Programmable Over Voltage Protection
- Drives up to 8 Strings Parallel 2.5% Current Regulation Accuracy Between Strings
- Programmable Switching Frequency:
- PWM or DC Input Burst PWM Dimming
- Open and Short LED Load Protection
- Thermal Shutdown
- Flexible Extended Channels Applications

## APPLICATIONS

- Notebook PC
- LCD Monitor
- LCD TV
- Handy Terminals Display
- Automotive Systems and Tablet Computer

All MPS parts are lead-free and adhere to the RoHS directive. For MPS green status, please visit MPS website under Quality Assurance. "MPS" and "The Future of Analog IC Technology" are Registered Trademarks of Monolithic Power Systems, Inc.

## QUICK START GUIDE

1. Connect the positive and negative terminals of the load panel (12 white LEDs in series, 8 strings paralleled) to the LED+ and LED1~8 pins on the EV board, respectively.
2. Connect the positive and negative terminals of the power supply (10V ~ 28V) to the VIN and GND pins on the EV board, respectively.
3. Drive EN pin high (5V) to enable the MP3391EY.
4. For PWM dimming, connect a 100k $\Omega$  resistor from BOSC pin to GND and apply a PWM rectangular waveform on DBRT pin. The minimum recommended amplitude of the PWM signal is 1.2V. PWM signal is recommended between 100Hz to 2kHz.
5. If 16 LED strings is required, please add 0 $\Omega$  resistor (0603) on R32, R33 and R36 to make the two ICs work in parallel.
