### Typical Applications

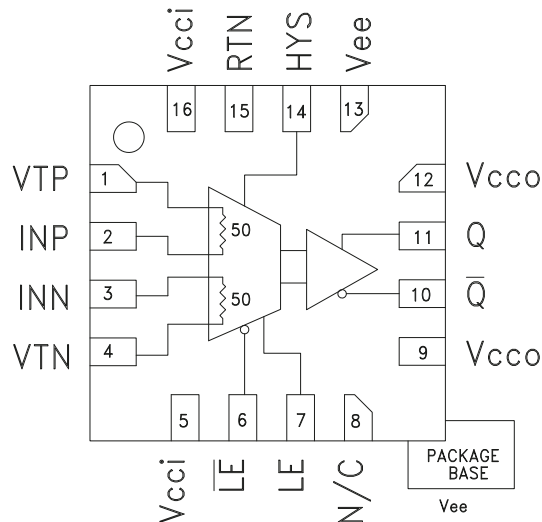

The HMC674LC3C is ideal for:

- ATE Applications
- High Speed Instrumentation
- Digital Receiver Systems
- Pulse Spectroscopy
- High Speed Trigger Circuits
- Clock & Data Restoration

### Features

- Equivalent Input Bandwidth: 10 GHz
- Propagation Delay: 85 ps
- Overdrive & Slew Rate Dispersion: 10 ps
- Minimum Pulse Width: 60 ps
- Resistor Programmable Hysteresis
- Differential Latch Control
- Power Dissipation: 140 mW
- RSCML Version Available
- 16 Lead 3x3 mm SMT Package: 9 mm<sup>2</sup>

### Functional Diagram

### General Description

The HMC674LC3C is a SiGe monolithic, ultra fast comparator. The comparator supports 10 Gbps operation while providing 85 ps propagation delay and 60 ps minimum pulse width with 0.2 ps rms random jitter (RJ). Overdrive and slew rate dispersion are typically 10 ps, making the device ideal for a wide range of applications from ATE to broadband communications. The output stages are designed to directly drive 400 mV into 50 ohms terminated to  $V_{tt} = (V_{cco} - 2.0 V)$ . The HMC674LP3E features high speed latch and programmable hysteresis and may be configured to operate in either latch mode, or as a tracking comparator.

**Timing Descriptions**

Symbol	Timing	Description
$t_{PDH}$	Input to output high delay	Propagation delay measured from the time the input signal crosses the reference ( $\pm$ the input offset voltage) to the 50% point of an output low-to-high transition.
$t_{PDL}$	Input to output low delay	Propagation delay measured from the time the input signal crosses the reference ( $\pm$ the input offset voltage) to the 50% point of an output high-to-low transition.
$t_{PLOH}$	Latch enable to output high delay	Propagation delay measured from the 50% point of the latch enable signal high-to-low transition to the 50% point of an output low-to-high transition.
$t_{PLOL}$	Latch enable to output low delay	Propagation delay measured from the 50% point of the latch enable signal high-to-low transition to the 50% point of an output high-to-low transition.
$t_H$	Minimum hold time	Minimum time after the positive transition of the latch enable signal that the input signal must remain unchanged to be acquired and held at the outputs.
$t_{PL}$	Minimum latch enable pulse width	Minimum time that the latch enable signal must be low to acquire an input signal change.
$t_S$	Minimum setup time	Minimum time before the positive transition of the latch enable signal that an input signal change must be present to be acquired and held at the outputs.
$t_R$	Output rise time	Amount of time required to transition from a low to a high output as measured at the 20% and 80% points.
$t_F$	Output fall time	Amount of time required to transition from a high to a low output as measured at the 20% and 80% points.
$V_{OD}$	Voltage overdrive	Difference between the input voltages $V_{INP}$ and $V_{INN}$ .

## **Operational Description**

The HMC674LC3C is a Latched Comparator with 10 GHz equivalent input bandwidth. The device is comprised of three blocks: 1) An input amplifier, 2) A latch, and 3) An Output Buffer. The latching circuit is level sensitive, and consists of a single high-speed latch. The HMC674LC3C comparator supports 10 Gb/s operation. The minimum input data latching pulse width is 60 ps.

The HMC674LC3C operates in either Track (Transparent) Mode, where the output follows the logical value of the input, or the Latch (Hold) Mode, where the output value is held to the logical value of the comparison result of the input just prior to (LE - LE\_bar) going HI. Track Mode operation is selected by either 1) (LE - LE\_bar) LO, or 2) LE and LE\_bar inputs floating. Latch Mode is selected by (LE - LE\_bar) HI. The input impedance of the LE and LE\_bar inputs is 8 k ohms, but these inputs can be terminated with 50 ohm external resistors if desired.

When DC coupled, the clock inputs operate at an input common mode voltage of 2 V. In this case, any termination resistors would ideally be returned to 2 V. If the clock is AC coupled to the device, the input termination resistors can be returned to ground.

## **Power Sequencing**

As long as the input signal is not near the -2 V extreme, either Vcc or Vee can be powered on first. However, if the input voltage is more negative than -1.8 V, we recommend the following power-up sequence.

- 1) Vee
- 2) Vcci and Vcco (if Vcco = Vcci)
- 3) Vcco (if different than ground).

Power down would be the reverse of this sequence.

It is also recommended that the device be powered before applying the input signal and also that the input signal be removed prior to power down. This is most important if any of the inputs are more negative than -1.8 V.

**Absolute Maximum Ratings**

Input Supply Voltage (V <sub>cci</sub> to GND)	-0.5 V to +4 V
Output Supply Voltage (V <sub>cco</sub> to GND)	-0.5 V to +4 V
Positive Supply Voltage Differential (V <sub>cci</sub> - V <sub>cco</sub> )	-0.5 V to +3.3 V
Input Voltage	-2 V to +2 V
Differential Input Voltage	-2 V to +2 V
Input Voltage, Latch Enable	-0.5 V to V <sub>cci</sub> +0.5 V
Applied Voltage (HYS)	V <sub>ee</sub> to GND
Maximum Input Current	±20 mA
Output Current	40 mA
Junction Temperature	125°C
Continuous P <sub>diss</sub> (T = 85°C) (Derate 20.4 mW/°C above 85°C)	0.816 W
Thermal Resistance (R <sub>th</sub> ) (Junction to Lead)	49°C/W
Storage Temperature	-65°C to +150°C
Operating Temperature	-40°C to +85°C
ESD Sensitivity (HBM)	Class 1A

PCB	125929 Evaluation PCB

The circuit board used in the application should use RF circuit design techniques. Signal lines should have 50 ohm impedance while the package ground leads should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes in order to provide good RF grounding to 10 GHz. The evaluation circuit board shown is available from Hittite upon request.
