

FEATURES

- 4 differential transmitters**
- 4 differential receivers**
- 2 observation receivers with 2 inputs each**
- Center frequency: 75 MHz to 6000 MHz**
- Maximum receiver bandwidth: 200 MHz**
- Maximum transmitter large signal bandwidth: 200 MHz**
- Maximum transmitter synthesis bandwidth: 450 MHz**
- Maximum observation receiver bandwidth: 450 MHz**
- Fully integrated independent fractional-N radio frequency synthesizers**
- Fully integrated clock synthesizer**
- Multichip phase synchronization for all local oscillators and baseband clocks**
- Support for TDD and FDD applications**
- 24.33 Gbps JESD204B/JESD204C digital interface**

APPLICATIONS

- 3G/4G/5G TDD and FDD massive MIMO, macro and small cell base stations**

GENERAL DESCRIPTION

The ADRV9026 is a highly integrated, radio frequency (RF) agile transceiver offering four independently controlled transmitters, dedicated observation receiver inputs for monitoring each transmitter channel, four independently controlled receivers, integrated synthesizers, and digital signal processing functions providing a complete transceiver solution. The device provides the performance demanded by cellular infrastructure applications, such as small cell base station radios, macro 3G/4G/5G systems, and massive multiple in/multiple out (MIMO) base stations.

The receiver subsystem consists of four independent, wide bandwidth, direct conversion receivers with wide dynamic range. The four independent transmitters use a direct conversion modulator resulting in low noise operation with low power consumption. The device also includes two wide bandwidth, time shared, observation path receivers with two inputs each for monitoring transmitter outputs.

The complete transceiver subsystem includes automatic and manual attenuation control, dc offset correction, quadrature error correction (QEC), and digital filtering, eliminating the need for these functions in the digital baseband. Other auxiliary functions such as analog-to-digital converters (ADCs), digital-to-analog converters (DACs), and general-purpose input/outputs (GPIOs) that provide an array of digital control options are also integrated.

To achieve a high level of RF performance, the transceiver includes five fully integrated phase-locked loops (PLLs). Two PLLs provide low noise and low power fractional-N RF synthesis for the transmitter and receiver signal paths. A third fully integrated PLL supports an independent local oscillator (LO) mode for the observation receiver. The fourth PLL generates the clocks needed for the converters and digital circuits, and a fifth PLL provides the clock for the serial data interface.

A multichip synchronization mechanism synchronizes the phase of all LOs and baseband clocks between multiple ADRV9026 chips. All voltage controlled oscillators (VCOs) and loop filter components are integrated and adjustable through the digital control interface.

The serial data interface consists of four serializer lanes and four deserializer lanes. The interface supports both the JESD204B and JESD204C standards, operating at data rates up to 24.33 Gbps. The interface also supports interleaved mode for lower bandwidths, thus reducing the number of high speed data interface lanes to one. Both fixed and floating-point data formats are supported. The floating-point format allows internal automatic gain control (AGC) to be invisible to the demodulator device.

The ADRV9026 is powered directly from 1.0 V, 1.3 V, and 1.8 V regulators and is controlled via a standard serial peripheral interface (SPI) serial port. Comprehensive power-down modes are included to minimize power consumption in normal use. The ADRV9026 is packaged in a 14 mm × 14 mm, 289-ball chip scale ball grid array (CSP_BGA).

Changes to General Section and Observation Receiver Section.....	114
Added Table 14; Renumbered Sequentially	114
Added JTAG Boundary Scan Section, Table 15, and Table 16.....	116
Changes to Data Interface Section, Table 17, Table 18, and Table 19.....	117

11/2019—Revision 0: Initial Version

FUNCTIONAL BLOCK DIAGRAM

¹VDDA_1P8 REPRESENTS VCONV1_1P8, VCONV2_1P8, VANA1_1P8, VANA2_1P8, VANA3_1P8, VANA4_1P8, AND VJVCO_1P8.
²VDDA_1P3 REPRESENTS VANA1_1P3, VANA2_1P3, VCONV1_1P3, VCONV2_1P3, VRFVCO1_1P3, VRFVCO2_1P3, VAUXVCO_1P3, VCLKVCO_1P3, VRFSYN1_1P3, VRFSYN2_1P3, VCLKSYN_1P3, VAUXSYN_1P3, VRXLO_1P3, AND VTXLO_1P3.
³VDDA_1P0 REPRESENTS VJSYN_1P0, VDES_1P0, VTT_DES, AND VUSER_1P0.

Figure 1.

22382-001

SPECIFICATIONS

Electrical characteristics at ambient temperature range. Power supplies are as follows: VDDA_1P8 = 1.8 V, VIF = 1.8 V, VDDA_1P3 = 1.3 V, VDDA_1P0 = 1.0 V, and VDIG_1P0 = 1.0 V. VDDA_1P8 represents VCONV1_1P8, VCONV2_1P8, VANA1_1P8, VANA2_1P8, VANA3_1P8, VANA4_1P8, and VJVCO_1P8. VDDA_1P3 represents VANA1_1P3, VANA2_1P3, VCONV1_1P3, VCONV2_1P3, VRFVCO1_1P3, VRFVCO2_1P3, VAUXVCO_1P3, VCLKVCO_1P3, VRFSYN1_1P3, VRFSYN2_1P3, VCLKSYN_1P3, VAUXSYN_1P3, VRXLO_1P3, and VTXLO_1P3. VDDA_1P0 represents VJSYN_1P0, VDES_1P0, VTT_DES, and VSER_1P0. All RF specifications are based on measurements that include printed circuit board (PCB) and matching circuit losses, unless otherwise noted.

Device configuration profile: Receiver = 200 MHz bandwidth, I/Q rate = 245.76 MHz, transmitter = 200 MHz large signal bandwidth plus 450 MHz synthesis bandwidth, I/Q rate = 491.52 MHz, observation receiver (OR_x) = 450 MHz bandwidth, I/Q rate = 491.52 MHz, device clock = 245.76 MHz, unless otherwise noted. Characterization at 75 MHz followed this profile: Receiver = 62.5 MHz bandwidth, I/Q rate = 76.8 MHz, transmitter = 62.5 MHz large signal bandwidth plus 141 MHz synthesis bandwidth, I/Q rate = 153.6 MHz, observation receiver = 141 MHz bandwidth, I/Q rate = 153.6 MHz, device clock = 153.6 MHz.

Note: if signals are placed outside of the primary bandwidth, degradation in linearity, image rejection, and flatness may be observed.

TRANSMITTERS AND RECEIVERS

Table 1.

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions/Comments
TRANSMITTERS						
Center Frequency	Tx	75		6000	MHz	
Tx Synthesis Bandwidth				450	MHz	
Tx Large Signal Bandwidth				200	MHz	Zero intermediate frequency (IF) mode
Peak-to-Peak Gain Deviation			1.0		dB	450 MHz bandwidth, includes compensation by programmable finite impulse response (FIR) filter
			0.1		dB	Any 20 MHz bandwidth span, includes compensation by programmable FIR filter (pFIR)
Deviation from Linear Phase			1		Degrees	450 MHz bandwidth
Maximum Output Power						0 dBFS, 1 MHz signal input, 50 Ω load, 0 dB transmitter attenuation
75 MHz			7.0		dBm	
800 MHz			6.7		dBm	
1800 MHz			6.6		dBm	
2600 MHz			6.3		dBm	
3800 MHz			6.4		dBm	
4800 MHz			6.1		dBm	
5700 MHz			6.4		dBm	
Power Control Range			32		dB	
Power Control Resolution			0.05		dB	
Attenuation Accuracy						
Integral Nonlinearity (Gain)	INL		0.1		dB	Valid over full power control range for any 4 dB step
Differential Nonlinearity (Gain)	DNL		±0.04		dB	Monotonic
Output Power Temperature Slope			-4.5		mdB/°C	Valid over full power control range
LO Delay Temperature Slope			1.05		ps/°C	Valid over full power control range
Adjacent Channel Leakage Power Ratio (ACLR) Long Term Evolution (LTE)						20 MHz LTE at -12 dBFS
75 MHz			-64		dB	
800 MHz			-68		dB	
1800 MHz			-67		dB	
2600 MHz			-66		dB	
3800 MHz			-65		dB	
4800 MHz			-65		dB	
5700 MHz			-65		dB	

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions/Comments
In Band Noise Floor			-154.5		dBFS/Hz	0 dB attenuation; in band noise falls 1 dB for each decibel of attenuation for attenuation settings between 0 dB and 20 dB
Interpolation Images			-76		dBc	
Tx to Tx Isolation: All Tx Output Effects on All Other Tx Outputs						
800 MHz			78		dB	
1800MHz			77		dB	
2600 MHz			77		dB	
3800 MHz			71		dB	
4800 MHz			70		dB	
5700 MHz			65		dB	
Image Rejection						
Within 200 MHz Large Signal Bandwidth						QEC active up to 20 dB of attenuation, continuous wave tone swept across the large signal bandwidth
75 MHz			80		dB	
800 MHz			76		dB	
1800 MHz			75		dB	
2600 MHz			73		dB	
3800 MHz			65		dB	
4800 MHz			64		dB	
5700 MHz			61		dB	
Beyond Large Signal Bandwidth						Assumes that distortion power density is 25 dB below desired power density
800 MHz			40		dB	
1800 MHz			38		dB	
2600 MHz			34		dB	
3800 MHz			37		dB	
4800 MHz			37		dB	
5700 MHz			37		dB	
Output Impedance	Z _{OUT}		50		Ω	Differential—nominal
Maximum Output Load Voltage Standing Wave Ratio	VSWR			3		Maximum value to ensure adequate calibration
Output Return Loss			10		dB	
Output Third-Order Intercept Point	OIP3					0 dB transmitter attenuation
75 MHz			30		dBm	
800 MHz			29		dBm	
1800 MHz			29		dBm	
2600 MHz			28		dBm	
3800 MHz			26.5		dBm	
4800 MHz			29		dBm	
5700 MHz			27		dBm	
Carrier Leakage						With LO leakage correction active, 0 dB transmitter attenuation, scales decibel for decibel with attenuation
Carrier Offset from LO						
75 MHz LO			-84		dBFS/MHz	
800 MHz LO			-84		dBFS/MHz	
1800 MHz LO			-84		dBFS/MHz	
2600 MHz LO			-83		dBFS/MHz	
3800 MHz LO			-84		dBFS/MHz	
4800 MHz LO			-84		dBFS/MHz	
5700 MHz LO			-83		dBFS/MHz	

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions/Comments
Carrier on the LO			-71		dBFS/MHz	Measured using an LTE 20 MHz signal
Error Vector Magnitude	EVM					PLL optimized for narrow-band noise, measured using LTE 20 MHz signal
75 MHz LO			0.25		%	50 kHz PLL bandwidth
800 MHz LO			0.38		%	50 kHz PLL bandwidth
1800 MHz LO			0.60		%	50 kHz PLL bandwidth
2600 MHz LO			0.44		%	500 kHz PLL bandwidth
3800 MHz LO			0.53		%	200 kHz PLL bandwidth
4800 MHz LO			0.63		%	400 kHz PLL bandwidth
5700 MHz LO			0.84		%	500 kHz PLL bandwidth
Transmitter Time Division Duplex	TDD					
Time from $\overline{\text{SPI_EN}}$ Going High to Change in Tx Attenuation	t_{SCH}		12		ns	
Time Between Consecutive Microattenuation Steps	t_{ACH}		20		ns	A large change in attenuation can be segmented into a series of smaller attenuation changes
Attenuation Overshoot During Transition			0.1		dB	
Change in Attenuation per Microstep			0.1		dB	
RECEIVERS	Rx					
Center Frequency		75		6000	MHz	
Gain Range			30		dB	
Attenuation Accuracy						
Analog Gain Step			0.5		dB	Attenuator steps from 0 dB to 6 dB
			1		dB	Attenuator steps from 6 dB to 30 dB
Residual Gain Step Error			0.1		dB	
Gain Temperature Slope			-6.4		mdB/°C	
Internal LO Delay Temperature Slope			1.0		ps/°C	
Frequency Response						
Peak-to-Peak Gain Deviation			1		dB	200 MHz bandwidth, includes compensation by programmable FIR filter
			0.2		dB	Any 20 MHz span, includes compensation by programmable FIR filter
Rx Bandwidth				200	MHz	Zero IF mode
Rx Alias Band Rejection					dB	Due to digital filters
Maximum Useable Input Level	P_{HIGH}					This continuous wave signal level corresponds to the input power that produces -2 dBFS at the digital output with 0 dB channel attenuation
75 MHz			-11.7		dBm	
800 MHz			-12.4		dBm	
1800 MHz			-12.7		dBm	
2600 MHz			-11.9		dBm	
3800 MHz			-11.0		dBm	
4800 MHz			-12.0		dBm	
5700 MHz			-11.1		dBm	
Maximum Source VSWR				3		
Input Impedance	Z_{IN}		100		Ω	Differential
Input Port/Return Loss			10		dB	Unmatched differential port return loss

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions/Comments
Noise Figure	NF					0 dB receiver attenuation, measured at single-ended input, matching circuit included
75 MHz			12		dB	
800 MHz			11		dB	
1800 MHz			11.5		dB	
2600 MHz			11.9		dB	
3800 MHz			12.8		dB	
4800 MHz			13.3		dB	
5700 MHz			14.5		dB	
Noise Figure Ripple			1.5		dB	At band edge
Second-Order Input Intermodulation Intercept Point	IIP2					0 dB attenuation, complex
75 MHz			70		dBm	
800 MHz			65		dBm	
1800 MHz			65		dBm	
2600 MHz			65		dBm	
3800 MHz			62		dBm	
4800 MHz			62		dBm	
5700 MHz			58		dBm	
Wideband Third-Order Input Intermodulation Intercept Point, Difference Product	IIP3 _{WB_DIFF}					Two tones near the band edge, test condition: P _{HIGH} – 9 dB/tone
75 MHz			14		dBm	
800 MHz			15		dBm	
1800 MHz			17		dBm	
2600 MHz			17		dBm	
3800 MHz			17		dBm	
4800 MHz			17		dBm	
5700 MHz			18		dBm	
Midband Third-Order Input Intermodulation Intercept Point, Difference Product	IIP3 _{MB_DIFF}					Two tones near the middle of the band; test condition: P _{HIGH} – 9 dB/tone
75 MHz			20		dBm	
800 MHz			18		dBm	
1800 MHz			22		dBm	
2600 MHz			21		dBm	
3800 MHz			22		dBm	
4800 MHz			22		dBm	
5700 MHz			20		dBm	
Wideband Third-Order Input Intermodulation Intercept Point, Sum Product	IIP3 _{WB_SUM}					Two tones approximately bandwidth ÷ 6 offset from the LO; test condition: P _{HIGH} – 9 dB/tone
75 MHz			15		dBm	
800 MHz			17		dBm	
1800 MHz			17		dBm	
2600 MHz			20		dBm	
3800 MHz			23		dBm	
4800 MHz			23		dBm	
5700 MHz			20		dBm	
Second-Order Harmonic Distortion Maximum Input	HD2 _{MAX}		–72		dBc	P _{HIGH} continuous wave signal, harmonic distortion tones falling within 100 MHz of the LO
Recommended Input	HD2		–75		dBc	P _{HIGH} – 3 dB continuous wave signal, harmonic distortion tones falling within 100 MHz of the LO

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions/Comments
Third-Order Harmonic Distortion Maximum Input	HD3 _{MAX}		-66		dBc	P _{HIGH} continuous wave signal, harmonic distortion tones falling within 100 MHz of the LO
Recommended Input	HD3		-72		dBc	P _{HIGH} - 3 dB continuous wave signal, harmonic distortion tones falling within 100 MHz of the LO
Fourth-Order Harmonic Distortion Maximum Input	HD4 _{MAX}		-90		dBc	P _{HIGH} continuous wave signal, harmonic distortion tones falling within 100 MHz of the LO
Recommended Input	HD4		-90		dBc	P _{HIGH} - 3 dB continuous wave signal, harmonic distortion tones falling within 100 MHz of the LO
Fifth-Order Harmonic Distortion Maximum Input	HD5 _{MAX}		-87		dBc	P _{HIGH} continuous wave signal, harmonic distortion tones falling within 100 MHz of the LO
Recommended Input	HD5		-90		dBc	P _{HIGH} - 3 dB continuous wave signal, harmonic distortion tones falling within 100 MHz of the LO
Image Rejection Rx to Rx Signal Isolation			75		dB	QEC active, within 200 MHz receiver bandwidth
75 MHz			80		dB	
800 MHz			75		dB	
1800 MHz			70		dB	
2600 MHz			70		dB	
3800 MHz			65		dB	
4800 MHz			62		dB	
5700 MHz			60		dB	
Rx Band Spurs Referenced to RF Input at Maximum Gain			-95		dBm	No more than one spur at this level per 10 MHz of receiver bandwidth; excludes harmonics of the reference clock
Spurious-Free Dynamic Range	SFDR		81		dBc	P _{HIGH} continuous wave signal anywhere inside the band ±20 MHz, excludes harmonic distortion products
Rx Input LO Leakage at Maximum Gain						Leakage decreased decibel for decibel with attenuation for first 12 decibels
75 MHz			-68		dBm	
800 MHz			-68		dBm	
1800 MHz			-68		dBm	
2600 MHz			-65		dBm	
3800 MHz			-65		dBm	
4800 MHz			-58		dBm	
5700 MHz			-54		dBm	
Tx to Rx Signal Isolation: All Tx Output Effects on all Rx Inputs						
75 MHz			80		dB	
800 MHz			80		dB	
1800 MHz			75		dB	
2600 MHz			75		dB	
3800 MHz			65		dB	
4800 MHz			65		dB	
5700 MHz			65		dB	
OBSERVATION RECEIVERS	ORx					
Center Frequency		75		6000	MHz	
Gain Range			30		dB	
Attenuation Accuracy			0.5		dB	Attenuator steps from 0 dB to 6 dB
Analog Gain Step			1		dB	Attenuator steps from 6 dB to 30 dB

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions/Comments
Peak-to-Peak Gain Deviation			1		dB	450 MHz RF bandwidth, compensation by programmable FIR filter
			0.1		dB	Any 20 MHz bandwidth span, compensation by programmable FIR filter
Deviation from Linear Phase			1		Degrees	450 MHz RF bandwidth
ORx Bandwidth				450	MHz	
ORx Alias Band Rejection		60			dB	Due to digital filters
Maximum Useable Input Level	P_{HIGH}					This continuous wave signal level corresponds to the input power that produces -2 dBFS at the digital output with 0 dB channel attenuation
75 MHz			-11.4		dBm	
800 MHz			-12.7		dBm	
1800 MHz			-11.5		dBm	
2600 MHz			-10.6		dBm	
3800 MHz			-12.0		dBm	
4800 MHz			-11.3		dBm	
5700 MHz			-9.5		dBm	
Input Impedance	Z_{IN}		100		Ω	Differential
Input Source VSWR				3		
Input Port Return Loss			10		dB	Unmatched differential port return loss
Integrated Noise						
450 MHz Bandwidth			-58.5		dBFS	Sample rate at maximum value integrated from 500 kHz to 225 MHz, no input signal
491.52 MHz Bandwidth (Nyquist)			-57.5		dBFS	Sample rate at maximum value integrated from 500 kHz to 245.76 MHz, no input signal
Second-Order Input Intermodulation Intercept Point	IIP2					Maximum observation receiver gain; test condition: $P_{HIGH} - 11$ dB/tone
75 MHz			55		dBm	
800 MHz			55		dBm	
1800 MHz			53		dBm	
2600 MHz			55		dBm	
3800 MHz			48		dBm	
4800 MHz			45		dBm	
5700 MHz			55		dBm	
Third-Order Input Intermodulation Intercept Point	IIP3					Maximum observation receiver gain; test condition: $P_{HIGH} - 11$ dB/tone
Narrow Band	IIP3 _{NB}					IM3 product < 130 MHz at baseband; test condition: $P_{HIGH} - 11$ dB/tone, 491.52 MSPS
75 MHz			11		dBm	
800 MHz			13.6		dBm	
1800 MHz			15		dBm	
2600 MHz			16.5		dBm	
3800 MHz			18		dBm	
4800 MHz			18		dBm	
5700 MHz			18		dBm	
Wide Band	IIP3 _{WB}					IM3 products > 130 MHz at baseband; test condition: $P_{HIGH} - 11$ dB/tone, 491.52 MSPS
800 MHz			7.8		dBm	
1800 MHz			13		dBm	
2600 MHz			11		dBm	
3800 MHz			13		dBm	
4800 MHz			13		dBm	
5700 MHz			14		dBm	

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions/Comments
Third-Order Intermodulation Product	IM3					
Narrow Band	IM3 _{NB}					IM3 product < 130 MHz at baseband; test condition: two tones, each at P _{HIGH} – 11 dB, 491.52 MSPS
800 MHz			-74		dBc	
1800 MHz			-79		dBc	
2600 MHz			-78.6		dBc	
3800 MHz			-80.4		dBc	
4800 MHz			-79.8		dBc	
5700 MHz			-76		dBc	
Wide Band	IM3 _{WB}					IM3 product > 130 MHz at baseband; test condition: two tones, each at P _{HIGH} – 11 dB, 491.52 MSPS
800 MHz			-62.4		dBc	
1800 MHz			-70		dBc	
2600 MHz			-67.6		dBc	
3800 MHz			-70.4		dBc	
4800 MHz			-69.8		dBc	
5700 MHz			-66		dBc	
Fifth-Order Intermodulation Product	IM5					
Narrow Band	IM5 _{NB}					IM5 product < 130 MHz at baseband; test condition: two tones, each at P _{HIGH} – 11 dB, 491.52 MSPS
800 MHz			-83		dBc	
1800 MHz			-87		dBc	
2600 MHz			-84		dBc	
3800 MHz			-80		dBc	
4800 MHz			-78		dBc	
5700 MHz			-81		dBc	
Wide Band	IM5 _{WB}					IM5 product > 130 MHz at baseband; test condition: two tones, each at P _{HIGH} – 11 dB, 491.52 MSPS
800 MHz			-83		dBc	
1800 MHz			-96		dBc	
2600 MHz			-85		dBc	
3800 MHz			-80		dBc	
4800 MHz			-77		dBc	
5700 MHz			-85		dBc	
Seventh-Order Intermodulation Product	IM7					
Narrow Band	IM7 _{NB}					IM7 product < 130 MHz at baseband; test condition: two tones, each at P _{HIGH} – 11 dB, 491.52 MSPS
800 MHz			-74		dBc	
1800 MHz			-78		dBc	
2600 MHz			-75		dBc	
3800 MHz			-73		dBc	
4800 MHz			-78		dBc	
5700 MHz			-75		dBc	

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions/Comments
Wide Band	IM7 _{WB}					IM7 product > 130 MHz at baseband; test condition: two tones, each at P _{HIGH} – 11 dB, 491.52 MSPS
800 MHz			–83		dBc	
1800 MHz			–82		dBc

AC-Coupled		0.95		1.05	V	
DC-Coupled		0.95		1.05	V	

ABSOLUTE MAXIMUM RATINGS

Table 9.

Parameter	Rating
VDDA_1P8 to VSSA	-0.3 V to +2.2 V
VDDA_1P3 to VSSA	-0.2 V to +1.5 V
VDDA_1P0, VDIG_1P0 to VSSD, VSSA	-0.2 V to +1.2 V
VIF Referenced Logic Inputs and Outputs to VSSD	-0.3 V to VIF + 0.3 V
JESD204B/JESD204C Logic Outputs to VSSA	-0.3 V to VSER_1P0
JESD204B/JESD204C Logic Inputs to VSSA	-0.3 V to VDES_1P0
Input Current to Any Pin Except Supplies	±10 mA
Maximum Input Power into RF Ports	See Table 11 for limits vs. survival time
Reflow Temperature	260°C
Junction Temperature Range ¹	-40°C to +110°C
Storage Temperature Range	-65°C to +150°C

¹ The maximum junction temperature for continuous operation is 110°C. See the Junction Temperature section for more details.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

JUNCTION TEMPERATURE

The maximum junction temperature for continuous operation is 110°C. Although operation up to 125°C is supported, specification compliance is only guaranteed up to 110°C. To avoid a reduction in operating lifetime by operating at temperatures greater than 110°C, the device must operate at a temperature less than 110°C for a period determined by the following equation:

$$t_{UNITS < 110} = (AF_{T > 110} - 1) / (1 - AF_{T < 110})$$

where:

AF is the acceleration factor.

$AF_{T > 110}$ and $AF_{T < 110}$ are acceleration factors obtained from Table 10.

For example, if the device operates at 125°C for 1 hour, expected device lifetime is maintained if the device operates at 100°C for 4.5 hours to offset the time operating above 110°C.

Table 10. Acceleration Factors for High Temperature Operation

Operating Junction Temperature (°C)	Acceleration Factor
125	3.75
120	2.44
115	1.57
110	1.00
105	0.63
100	0.39
95	0.24
90	0.14

Table 11. Maximum Input Power into RF Ports vs. Lifetime

RF Port Input Power, Continuous Wave Signal (dBm)	Lifetime	
	Gain = -30 dB	Gain = 0 dB
7	>10 years	>10 years
10	>10 years	20,000 hours
20	>10 years	14 hours
23	>10 years	110 minutes
25	>7 years	60 minutes

REFLOW PROFILE

The ADRV9026 reflow profile is in accordance with the JEDEC JESD20 criteria for lead-free (Pb-free) devices. The maximum reflow temperature is 260°C.

THERMAL RESISTANCE

Thermal resistance values specified in Table 12 are calculated based on JEDEC specifications and should be used in compliance with JESD51-2. Note that using enhanced heat removal techniques (PCB, heat sink, airflow, and so forth) improves thermal resistance.

Table 12. Thermal Resistance Values

Package Type	θ_{JA}	θ_{JTOP}	θ_{JB}	ψ_{JC}	ψ_{JB}	Unit
BC-289-6	14.8	0.03	3.4	0.02	3.4	(°C/W)

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

Table 13. Pin Function Descriptions

Pin No.	Mnemonic	Type ¹	Description
A1 to A3, A6, A8, A10 to A12, A15 to A17, B2, B3, B5 to B10, B12, B13, B15, B16, C2, C7, C10, C14, C16, D1, D2, D4 to D7, D10 to D14, D16, D17, E3, E6, E12, E15, F3 to F6, F12 to F15, G1, G2, G4, G6, G12, G14, G16, G17, H2, H4 to H6, H12 to H14, H16, J2, J4, J6, J12, J14, J16, K1, K2, K4 to K6, K12 to K14, K16, K17, L3, L6, L12, L15, M1 to M6, M12 to M17, N3, N4, P2 to P4, P9, P16, R1, R2, R5, R6, R8, R10, R12 to R14, R16, R17, T1, T2, T5, T6, T9, T12, T13, T16, T17, U3, U4, U7 to U11, U14, U15	VSSA	I	Analog Ground.
A4, A5	TX3+, TX3–	O	Differential Output for Transmitter Channel 3. If unused, do not connect these pins.
A7	VTXLO_1P3	I	1.3 V Supply Input.
A9	VRXLO_1P3	I	1.3 V Supply Input.
A13, A14	TX2+, TX2–	O	Differential Output for Transmitter Channel 2. When unused, do not connect.
B1, C1	RX3–, RX3+	I	Differential Input for Receiver Channel 3. If unused, connect these pins to VSSA.
B4	VANA3_1P8	I	1.8 V Supply Input.
B11	VAUXVCO_1P0	O	1.0 V Internal Supply Node. Bypass Pin B11 with a 4.7 μ F capacitor.
B14	VANA2_1P8	I	1.8 V Supply Input.
B17, C17	RX2+, RX2–	I	Differential Input for Receiver Channel 2. If unused, connect these pins to VSSA.
C3, R11	NIC	N/A	Not Internally Connected. These pins must remain disconnected.
C4, C5, L1, L2, L17, L16, C12, C13	GPIO_ANA_7 to GPIO_ANA_0	I/O	General-Purpose Inputs and Outputs. The GPIO_ANA_7 to GPIO_ANA_0 pins are referenced to 1.8 V and can also function as auxiliary DAC outputs. If unused, these pins can be connected to VSSA with a 10 k Ω resistor or configured as outputs, driven low, and left disconnected.
C6	VAUXSYN_1P3	I	1.3 V Supply Input.
C8, C9	DEVCLK+, DEVCLK–	I	Device Clock Differential Input.
C11	VAUXVCO_1P3	I	1.3 V Supply Input.
C15	RBIAS	I	Bias Resistor Connection. Pin C15 generates an internal current based on an external 1% resistor. Connect a 4.99 k Ω resistor between Pin C15 and analog ground (VSSA).
D3	VANA2_1P3	I	1.3 V Supply Input.
D8, D9	SYSREF+, SYSREF–	I	LVDS System Reference Clock Inputs for the SERDES Interface. Connect a 100 Ω termination between these pins.
D15	VANA1_1P3	I	1.3 V Supply Input.
E1	AUXADC_3	I	Auxiliary ADC 3 Input. If Pin E1 is unused, do not connect.
E2, F2	EXT_LO2–, EXT_LO2+	I/O	Differential External LO Input/Output 2. If used for the external LO input, the input frequency must be 2 \times the desired carrier frequency. Do not connect if unused. External LO functionality not supported currently.
E4, E5	ORX3+, ORX3–	I	Differential Input for Observation Receiver Channel 3. Connect to VSSA if unused.
E7	TX3_EN	I	Enable Input for Transmitter Channel 3. Connect to VSSA if unused.

Pin No.	Mnemonic	Type ¹	Description
H11, K11, N11, E10, F10, G10, H10, J10, K10, E9, F9, E8, F8, G8, H8, J8, K8, H7, K7	GPIO_0 to GPIO_18	I/O	General-Purpose Digital Inputs and Outputs. See Figure 2 to match the ball location to the GPIO_x signal name. If unused, these pins can be connected to VSSA with a 10 kΩ resistor or configured as outputs, driven low, and left disconnected.
E11	TX2_EN	I	Enable Input for Transmitter Channel 2. Connect to VSSA if unused.
E13, E14	ORX1+, ORX1–	I	Differential Input for Observation Receiver Channel 1. Connect to VSSA if unused.
E16, F16	EXT_LO1+, EXT_LO1–	I/O	Differential External LO Input/Output 1. If used for the external LO input, the input frequency must be 2× the desired carrier frequency. Do not connect if unused. External LO functionality not currently supported.
E17	AUXADC_1	I	Auxiliary ADC 1 Input. Do not connect if unused.
F1	AUXADC_2	I	Auxiliary ADC 2 Input. Do not connect if unused.
F7, F11, L7, L11	ORX_CTRL_C, ORX_CTRL_B, ORX_CTRL_D, ORX_CTRL_A	I	Determine Active Observation Receiver Path. Connect to VSSA directly or with a pull-down resistor if unused.
F17	AUXADC_0	I	Auxiliary ADC 0 Input. Do not connect if unused.
G3	VRFVCO2_1P3	I	1.3 V Supply Input.
G5	VRFVCO2_1P0	O	1.0 V Internal Supply Node. Bypass this pin with a 4.7 μF capacitor.
G7	RX3_EN	I	Enable Input for Receiver Channel 3. Connect to VSSA if unused.
G9, J9, L9	VDIG_1P0	I	1.0 V Digital Supply Input.
G11	RX2_EN	I	Enable Input for Receiver Channel 2. Connect to VSSA if unused.
G13	VRFVCO1_1P0	O	1.0 V Internal Supply Node. Bypass this pin with a 4.7 μF capacitor.
G15	VRFVCO1_1P3	I	1.3 V Supply Input.
H1, J1	RX4–, RX4+	I	Differential Input for Receiver Channel 4. If unused, connect to VSSA.
H3	VCONV2_1P8	I	1.8 V Supply Input.
H9, K9, M9	VSSD	I	Digital Ground.
H15	VCONV1_1P8	I	1.8 V Supply Input.
H17, J17	RX1+, RX1–	I	Differential Input for Receiver Channel 1. If unused, connect to VSSA.
J3	VCONV2_1P3	I	1.3 V Supply Input.
J5	VRFSYN2_1P3	I	1.3 V Supply Input.
J7	RX4_EN	I	Enable Input for Receiver Channel 4. If unused, connect to VSSA.
J11	RX1_EN	I	Enable Input for Receiver Channel 1. If unused, connect to VSSA.
J13	VRFSYN1_1P3	I	1.3 V Supply Input.
J15	VCONV1_1P3	I	1.3 V Supply Input.
K3	VCONV2_1P0	O	1.0 V Internal Supply Node. Bypass this pin with a 4.7 μF capacitor.
K15	VCONV1_1P0	O	1.0 V Internal Supply Node. Bypass this pin with a 4.7 μF capacitor.
L4, L5	ORX4+, ORX4–	I	Differential Input for Observation Receiver Channel 4. If unused, connect to VSSA.

Pin No.	Mnemonic	Type ¹	Description
L8	SPI_DIO	I/O	Serial Data Input. SPI_DIO is the serial data input in 4-wire mode or input/output in 3-wire mode.
L10	$\overline{\text{SPI_EN}}$	I	Serial Data Bus Chip Select. Active low.
L13, L14	ORX2+, ORX2-	I	Differential Input for Observation Receiver Channel 2. If unused, connect to VSSA.
M7	TX4_EN	I	Enable Input for Transmitter Channel 4. If unused, connect to VSSA.
M8	SPI_DO	O	Serial Data Output.
M10	SPI_CLK	I	Serial Data Bus Clock Input.
M11	TX1_EN	I	Enable Input for Transmitter Channel 1. If unused, connect to VSSA.
N1, P1	TX4-, TX4+	O	Differential Output for Transmitter Channel 4. If unused, do not connect.
N2	VANA4_1P8	I	1.8 V Supply Input.
N5	VCLKVCO_1P3	I	1.3 V Supply Input.
N6, P6	SYNCIN3+, SYNCIN3-	I	LVDS Sync Signal Input 3. If unused, connect to VSSA.
N7	GPINT2	O	General-Purpose Interrupt Output 2. If unused, do not connect.
N8	GPINT1	O	General-Purpose Interrupt Output 1. If unused, do not connect.
N9	VIF	I	1.8 V Interface Supply Input.
N10	$\overline{\text{RESET}}$	I	Active Low Chip Reset.
N12, N13	SYNCIN1+, SYNCIN1-	I	LVDS Sync Signal Input 1. If unused, connect to VSSA.
N14, N15	SYNCOUT2+, SYNCOUT2-	O	LVDS Sync Signal Output 2. If unused, do not connect.
N16	VANA1_1P8	I	1.8 V Supply Input.
N17, P17	TX1+, TX1-	O	Differential Output for Transmitter Channel 1. Do not connect if unused.
P5	VCLKVCO_1P0	O	1.0 V Internal Supply Node. Bypass this pin with a 4.7 μF capacitor.
P7, P8	SYNCIN2+, SYNCIN2-	I	LVDS Sync Signal Input 2. If unused, connect to VSSA.
P10	TEST_EN	I	Test Input for JTAG Boundary Scan. Pull high to enable boundary scan. If unused, tie to VSSA.
P11	VJSCO_1P8	I	1.8 V Supply Input.
P12, P13	VDES_1P0	I	1.0 V Analog Supply Input.
P14	VTT_DES	I	1.0 V Analog Supply Input.
P15, R15	SYNCOUT1+, SYNCOUT1-	O	LVDS Sync Signal Output 1. If unused, do not connect.
R3, R4	VSER_1P0	I	1.0 V Analog Supply Input.
R7	VCLKSYN_1P3	I	1.3 V Supply Input.
R9	VJSYN_1P0	I	1.0 V Analog Supply Input.
T3, T4	SERDOUTC+, SERDOUTC-	O	SERDES Differential Output C. If unused, do not connect.
T7, T8	SERDOUTA+, SERDOUTA-	O	SERDES Differential Output A. If unused, do not connect.
T10, T11	SERDINA-, SERDINA+	I	SERDES Differential Input A. If unused, do not connect.
T14, T15	SERDINC-, SERDINC+	I	SERDES Differential Input C. If unused, do not connect.
U1, U2	SERDOUTD+, SERDOUTD-	O	SERDES Differential Output D. If unused, do not connect.
U5, U6	SERDOUTB+, SERDOUTB-	O	SERDES Differential Output B. If unused, do not connect.

Pin No.	Mnemonic	Type ¹	Description
U12, U13	SERDINB+, SERDINB-	I	SERDES Differential Input B. If unused, do not connect.
U16, U17	SERDIND+, SERDIND-	I	SERDES Differential Input D. If unused, do not connect.

¹ I is input, O is output, I/O is input/output, and N/A is not applicable.

TYPICAL PERFORMANCE CHARACTERISTICS

Device configuration profile: receiver = 62.5 MHz bandwidth, I/Q rate = 76.8 MHz, transmitter = 62.5 MHz large signal bandwidth plus 141 MHz synthesis bandwidth, I/Q rate = 153.6 MHz, observation receiver (OR_x) = 141 MHz bandwidth, I/Q rate = 153.6 MHz, device clock = 153.6 MHz, unless otherwise noted.

75 MHz BAND

The temperature settings refer to the die temperature. All LO frequencies set to 75 MHz, unless otherwise noted.

THEORY OF OPERATION

GENERAL

The ADRV9026 is a highly integrated RF transceiver capable of configuration for a wide range of applications. The device integrates all the RF, mixed-signal, and digital blocks necessary to provide all transmitter, traffic receiver, and observation receiver functions in a single device. Programmability allows the device to be adapted for use in many 3G/4G/5G cellular standards in frequency division duplex (FDD) and time division duplex (TDD) modes.

Four observation receiver channels monitor the transmitter outputs and provide tracking correction of dc offset, quadrature error, and transmitter LO leakage to maintain a high performance level under varying temperatures and input signal conditions. Firmware supplied with the device implements all initialization and calibration with no user interaction. Additionally, the device includes test modes allowing system designers to debug designs during prototyping and to optimize radio configurations.

The ADRV9026 contains four high speed serial interface (SERDES) links for the transmit chain and four high speed links shared by the receiver and observation receiver chains (JESD204B Subclass 1 compliant and supports JESD204C).

TRANSMITTER

The ADRV9026 transmitter section consists of four identical and independently controlled channels that provide all the digital processing, mixed-signal, and RF blocks necessary to implement a direct conversion system while sharing a common frequency synthesizer. The digital data from the SERDES lanes pass through a digital processing block that includes a series of programmable half-band filters, interpolation stages, and FIR filters, including a programmable FIR filter with variable interpolation rates and up to 80 taps. The output of this digital chain is connected to the digital-to-analog converter (DAC). The DAC sample rate is adjustable up to 2.5 GHz. The in-phase (I) and quadrature (Q) channels are identical in each transmitter signal chain.

After conversion to baseband analog signals, the I and Q signals are filtered to remove sampling artifacts and fed to the upconversion mixers. Each transmit chain provides a wide attenuation adjustment range with fine granularity to help designers optimize signal-to-noise ratio (SNR).

RECEIVER

The ADRV9026 provides four independent receiver channels. Each channel contains all the blocks necessary to receive RF signals and convert these signals to digital data usable by a baseband processor. Each receiver can be configured as a direct conversion system that supports up to a bandwidth of 200 MHz. Each channel contains a programmable attenuator stage, followed by matched I and Q mixers that downconvert received signals to baseband for digitization.

Two gain control options are available, as follows:

- Users can implement their own gain control algorithms using their baseband processor to manage manual gain control mode
- Users can use the on-chip automatic gain control (AGC) system.

Performance is optimized by mapping each gain control setting to specific attenuation levels at each adjustable gain block in the receive signal path. Additionally, each channel contains independent receive signal strength indication (RSSI) measurement capability, dc offset tracking, and all the circuitry necessary for self calibration.

The receivers include analog-to-digital converters (ADCs) and adjustable sample rates that produce data streams from the received signals. The signals can be conditioned further by a series of decimation filters and a programmable FIR filter with additional decimation settings. The sample rate of each digital filter block is adjustable by changing decimation factors to produce the desired output data rate. All receiver outputs are connected to the SERDES block, where the data is formatted and serialized for transmission to the baseband processor.

OBSERVATION RECEIVER

The ADRV9026 provides four independent observation receiver inputs. These inputs are similar in implementation to the standard receiver channels in terms of the mixers, ADCs, and filtering blocks. The main difference is that these receivers operate with an observation bandwidth up to 450 MHz, allowing the receivers to receive all the transmitter channel information needed for implementing digital correction algorithms.

Each input is used as the feedback monitor channel for a corresponding transmitter channel. Table 14 shows the possible combinations of transmitter and observation channels.

Table 14. Possible Transmitter-Observation Channel Combinations

Transmitter Channel	Observation Channel
TX1±	ORX1± or ORX2±
TX2±	ORX1± or ORX2±
TX3±	ORX3± or ORX4±
TX4±	ORX3± or ORX4±

CLOCK INPUT

The ADRV9026 requires a differential clock connected to the DEVCLK± pins. The frequency of the clock input must be between 15 MHz and 1000 MHz and must have low phase noise because this signal generates the RF LO and internal sampling clocks.

SYNTHESIZERS

The ADRV9026 contains four fractional-N PLLs to generate the RF LO for the signal paths and all internal clock sources. This group of PLLs includes two RF PLLs for transmit and receive LO generation, an auxiliary PLL that can be used by the observation receivers, and a clock PLL. Each PLL is independently controlled with no need for external components to set frequencies.

RF Synthesizers

The two RF synthesizers use fractional-N PLLs to generate RF LOs for multiple receiver and transmitter channels. The fractional-N PLL incorporates a four-core internal voltage controlled oscillator (VCO) and loop filter, capable of generating low phase noise signals with no external components required. An internal LO multiplexer (mux) enables each PLL to supply LOs to any or all receivers and transmitters (for example, LO1 to all transmitters, LO2 to all receivers), resulting in maximum flexibility when configuring the device for TDD operation. The LOs on multiple devices can be phase synchronized to support active antenna systems and beam forming applications.

Auxiliary Synthesizer

The auxiliary synthesizer uses a single core VCO fractional-N PLL to generate the signals necessary to calibrate the device. The output of this block uses a separate mux system to route LOs for calibrating different functions during initialization. The auxiliary synthesizer can also be used to generate LO signals for the observation receivers or as an offset LO used in the receiver signal chains.

Clock Synthesizer

The ADRV9026 contains a single core VCO fractional-N PLL synthesizer that generates all baseband related clock signals and SERDES clocks. This fractional-N PLL is programmed based on the data rate and sample rate requirements of the system, which typically require the system to operate in integer mode.

For JESD204B configurations with $N_p = 12$ and JESD204C configurations, a dedicated PLL included in the SERDES block generates the SERDES clocks.

SPI INTERFACE

The ADRV9026 uses a SPI to communicate with the baseband processor. This interface can be configured as a 4-wire interface with dedicated receive and transmit ports, or the interface can be configured as a 3-wire interface with a bidirectional data communications port. This bus allows the baseband processor to set all device control parameters using a simple address data serial bus protocol.

Write commands follow a 24-bit format. The first bit sets the bus direction of the bus transfer. The next 15 bits set the address where data is written. The final eight bits are the data being transferred to the specific register address.

Read commands follow a similar format with the exception that the first 16 bits are transferred on the SPI_DIO pin, and the final eight bits are read from the ADRV9026, either on the SPI_DO pin in 4-wire mode or on the SPI_DIO pin in 3-wire mode.

GPIO_X PINS

The ADRV9026 provides 19 general-purpose input/output signals (GPIOs) referenced to VIF that can be configured for numerous functions. When configured as outputs, certain pins can provide real-time signal information to the baseband processor, allowing the baseband processor to determine receiver performance. A pointer register selects what information is output to these pins.

Signals used for manual gain mode, calibration flags, state machine status, and various receiver parameters are among the outputs that can be monitored on the GPIO pins. Additionally, certain GPIO pins can be configured as inputs and used for various functions, such as setting the receiver gain in real time.

AUXILIARY CONVERTERS

GPIO_ANA_x/AUXDAC_x

The ADRV9026 contains eight analog GPIOs (the GPIO_ANA_x pins) that are multiplexed with eight identical auxiliary DACs (AUXDAC_x). The analog GPIO ports can be used to control other analog devices or receive control inputs referenced to the VDDA_1P8 supply. The auxiliary DACs are 12-bit converters capable of supplying up to 10 mA. These outputs are typically used to supply bias current or variable control voltages for other related components with analog control inputs.

AUXADC_x

The ADRV9026 contains two auxiliary ADCs with four total input pins (AUXADC_x). These auxiliary ADCs provide 10-bit monotonic outputs with an input voltage range of 0.05 V to 0.95 V. When enabled, each auxiliary ADC is free running. An application programming interface (API) command latches the ADC output value to a register. The ADRV9026 also contains an ADC that supports a built-in diode-based temperature sensor.

JTAG BOUNDARY SCAN

The ADRV9026 provides support for a JTAG boundary scan. There are five dual function pins associated with the JTAG interface. These pins, listed in Table 15, are used to access the on-chip test access port. To enable the JTAG functionality, set the GPIO_0 pin through the GPIO_2 pin according to Table 16, depending on how the desired JESD204B sync signals are configured in the software (differential or single-ended mode). Pull the TEST_EN pin high to the VIF supply to enable the JTAG mode.

Table 15. Dual Function Boundary Scan Test Pins

Mnemonic	JTAG Mnemonic	Description
GPIO_14	TRST	Test access port reset
GPIO_15	TDO	Test data output
GPIO_16	TDI	Test data input
GPIO_17	TMS	Test access port mode select
GPIO_18	TCK	Test clock

Table 16. JTAG Modes

Test Pin Level	GPIO_2 to GPIO_0	Description
0	XXX ¹	Normal operation
1	000	JTAG mode with differential JESD204B sync signals
1	011	JTAG mode with single-ended JESD204B sync signals

¹ X means any combination.

APPLICATIONS INFORMATION

POWER SUPPLY SEQUENCE

The ADRV9026 requires a specific power-up sequence to avoid undesired power-up currents. In the optimal power-up sequence, the VDIG_1P0 supply is activated first. When VDIG_1P0 powers VDDA_1P0, then all 1.0 V supplies can be powered on at the same time.

If VDIG_1P0 is isolated, all VDDA_1P8, VDDA_1P3, and VDDA_1P0 supplies must be powered up after VDIG_1P0 is activated. The VIF supply can be powered up at any time.

It is also recommended prior to configuration to toggle the RESET signal after power has stabilized.

If a power-down sequence is followed, to avoid any back biasing of the digital control lines, remove the VDIG_1P0 supply last. If no sequencing is used, it is recommended to power down all supplies simultaneously.

DATA INTERFACE

The digital data interface for the ADRV9026 implements JEDEC Standard JESD204B Subclass 1 and JESD204C. The serial interface operates at speeds of up to 24,330.24 Mbps. Table 17, Table 18, and Table 19 list example parameters for various JESD interface settings. Other output rates, bandwidth, and number of lanes are also supported for each of the interface rates reported in Table 17, Table 18, and Table 19.

Table 17. Example Receiver Interface Rates with Four Channels Active (M = 8)

Bandwidth (MHz)	Output Rate (MSPS)	JESD Np Parameter	JESD204B F Parameter	JESD204B Lane Rate (Mbps)	JESD204B Number of Lanes	JESD204C F Parameter	JESD204C Lane Rate (Mbps)	JESD204C Number of Lanes
40	61.44	16	16	9830.4	1	16	8110.08	1
60	76.8	16	16	12288	1	16	10137.6	1
100	122.88	16	8	9830.4	2	8	8110.08	2
150	184.32	16	4	7372.8	4	8	12165.12	2
200	245.76	16	4	9830.4	4	4	8110.08	4
200	245.76	12	3	7372.8	4	6	12165.12	2
200	245.76	12	6	14745.6	2	12	24330.24	1

Table 18. Transmitter Interface Rates with Four Channels Active (M = 8)

Primary Signal Bandwidth (MHz)	Total Bandwidth (MHz)	Input Rate (MSPS)	JESD Np Parameter	JESD204B F Parameter	JESD204B Lane Rate (Mbps)	JESD204B Number of Lanes	JESD204C F Parameter	JESD204C Lane Rate (Mbps)	JESD204C Number of Lanes
50	113	122.88	16	8	9830.4	2	8	8110.08	2
75	150	184.32	16	4	7372.8	4	8	12165.12	2
100	225	245.76	16	4	9830.4	4	4	8110.08	4
100	225	245.76	12	3	7372.8	4	6	12165.12	2
200	450	491.52	12	3	14745.6	4	8	24330.24	2

Table 19. Observation Path Interface Rates with 1 Channel Active (M = 2)

Total Bandwidth (MHz)	Output Rate (MSPS)	JESD Np Parameter	JESD204B F Parameter	JESD204B Lane Rate (Mbps)	JESD204B Number of Lanes	JESD204C F Parameter	JESD204C Lane Rate (Mbps)	JESD204C Number of Lanes
150	184.32	16	4	7372.8	1	4	6082.56	1
225	245.76	16	4	9830.4	1	4	8110.08	1
225	245.76	12	3	7372.8	1	3	6082.56	1
250	307.2	16	4	12288	1	4	10137.6	1
300	368.64	16	2	7372.8	2	4	12165.12	1
