

## 1.8 V CapSense® Controller with SmartSense™ Auto-tuning 31 Buttons, 6 Sliders, Proximity Sensors

### Features

- QuietZone™ Controller
  - Patented Capacitive Sigma Delta PLUS (CSD PLUS™) sensing algorithm for robust performance
  - High Sensitivity (0.1 pF) and best-in-class SNR performance to support:
    - Overlay thickness of 15 mm for glass and 5 mm plastic
    - Proximity Solutions
  - Superior noise immunity performance against conducted and radiated noise and ultra low radiated emissions
    - Standardized user modules for overcoming noise
- Low power CapSense® block with SmartSense Auto-tuning
  - Low average power consumption –
    - 28 µA/sensor in run time (wake-up and scan once every 125 ms)
  - SmartSense\_EMC\_PLUS Auto-Tuning
    - Sets and maintains optimal sensor performance during run time
    - Eliminates system tuning during development and production
    - Compensates for variations in manufacturing process
- Driven shield available on five GPIO pins
  - Delivers best-in class water tolerant designs
  - Robust proximity sensing in the presence of metal objects
  - Supports longer trace lengths
  - Max load of 100 pF (3 MHz)
- Powerful Harvard-architecture processor
  - M8C CPU with a max speed of 24 MHz
- Operating Range: 1.71 V to 5.5 V
  - Standby Mode 1.1 µA (Typ)
  - Deep Sleep 0.1 µA (Typ)
- Operating Temperature range: –40 °C to +85 °C
- Flexible on-chip memory
  - 8 KB flash, 1 KB SRAM
  - 16 KB flash, 2 KB SRAM
  - 32 KB flash, 2 KB SRAM
  - 50,000 flash erase/write cycles
  - Read while Write with EEPROM emulation
  - In-system programming simplifies manufacturing process
- 4 Clock Sources
  - Internal main oscillator (IMO): 6/12/24 MHz
  - Internal low-speed oscillator (ILO) at 32 kHz for watchdog and sleep timers
  - External 32 KHz Crystal Oscillator
  - External Clock Input
- Programmable pin configurations
  - Up to 34 general-purpose I/Os (GPIOs)
  - Dual mode GPIO (Analog and Digital)
  - High sink current of 25 mA per GPIO
    - Max sink current 120 mA for all I/Os combined
  - Source Current
    - 5 mA on ports 0 and 1
    - 1 mA on ports 2, 3 and 4
  - Configurable internal pull-up, high-Z and open drain modes
  - Selectable, regulated digital I/O on port 1
  - Configurable input threshold on port 1
- Versatile Analog functions
  - Internal analog bus supports connection of multiple sensors to form ganged proximity sensor
  - Internal Low-Dropout voltage regulator for high power supply rejection ratio (PSRR)
- Additional system resources
  - I<sup>2</sup>C Slave:
    - Selectable to 50 kHz, 100 kHz, or 400 kHz
    - Selectable Clock stretch or Forced Nack Mode
    - I<sup>2</sup>C wake from sleep with Hardware address match
  - 12 MHz (Configurable) SPI master and slave
  - Three 16-bit timers
  - Watchdog and sleep timers
  - Integrated supervisory circuit
  - 10-bit incremental analog-to-digital converter (ADC) with internal voltage reference
  - Two general-purpose high speed, low power analog comparators
- Complete development tools
  - Free development tool (PSoC Designer™)
- Sensor and Package options
  - 10 Sensing Inputs – 16-pin QFN, 16-pin SOIC
  - 16 Sensing Inputs – 24-pin QFN
  - 24 Sensing Inputs – 30-pin WLCSP
  - 25 Sensing Inputs – 32-pin QFN
  - 31 Sensing Inputs – 48-pin QFN

## PSoC<sup>®</sup> Functional Overview

The PSoC family consists of many devices with on-chip controllers. These devices are designed to replace multiple traditional MCU-based system components with one low-cost single-chip programmable component. A PSoC device includes configurable blocks of analog and digital logic, and programmable interconnect. This architecture makes it possible for you to create customized peripheral configurations, to match the requirements of each individual application. Additionally, a fast central processing unit (CPU), flash program memory, SRAM data memory, and configurable I/O are included in a range of convenient pinouts.

The architecture for this device family, as shown in the “Logic Block Diagram” on page 2, consists of three main areas:

- The core
- CapSense analog system
- System resources

A common, versatile bus allows connection between I/O and the analog system.

Each CY8C20x37/47/67/S PSoC device includes a dedicated CapSense block that provides sensing and scanning control circuitry for capacitive sensing applications. Depending on the PSoC package, up to 34 GPIOs are also included. The GPIOs provide access to the MCU and analog mux.

### PSoC Core

The PSoC core is a powerful engine that supports a rich instruction set. It encompasses SRAM for data storage, an interrupt controller, sleep and watchdog timers, and IMO and ILO. The CPU core, called the M8C, is a powerful processor with speeds up to 24 MHz. The M8C is a 4-million instructions per second (MIPS), 8-bit Harvard-architecture microprocessor.

### CapSense System

The analog system contains the capacitive sensing hardware. Several hardware algorithms are supported. This hardware performs capacitive sensing and scanning without requiring external components. The analog system is composed of the CapSense PSoC block and an internal 1 V or 1.2 V analog reference, which together support capacitive sensing of up to 31 inputs<sup>[2]</sup>. Capacitive sensing is configurable on each GPIO pin. Scanning of enabled CapSense pins is completed quickly and easily across multiple ports.

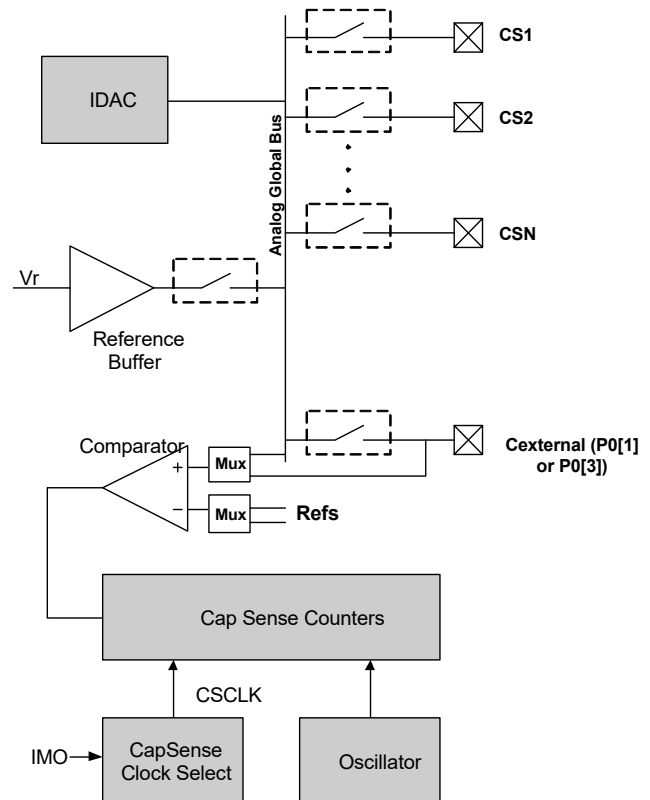

#### SmartSense™ Auto-tuning

SmartSense auto-tuning is an innovative solution from Cypress that removes manual tuning of CapSense applications. This solution is easy to use and provides robust noise immunity. It is the only auto-tuning solution that establishes, monitors, and maintains all required tuning parameters of each sensor during run time. SmartSense auto-tuning allows engineers to go from prototyping to mass production without retuning for manufacturing variations in PCB and/or overlay material properties.

#### Note

2. 34 GPIOs = 31 pins for capacitive sensing + 2 pins for I<sup>2</sup>C + 1 pin for modulator capacitor.

Figure 1. CapSense System Block Diagram

#### Analog Multiplexer System

The analog mux bus can connect to every GPIO pin. Pins are connected to the bus individually or in any combination. The bus also connects to the analog system for analysis with the CapSense block comparator.

Switch-control logic enables selected pins to precharge continuously under hardware control. This enables capacitive measurement for applications such as touch sensing. Other multiplexer applications include:

- Complex capacitive sensing interfaces, such as sliders and touchpads.
- Chip-wide mux that allows analog input from any I/O pin.
- Crosspoint connection between any I/O pin combinations.

## Additional System Resources

System resources provide additional capability, such as configurable I<sup>2</sup>C slave, SPI master/slave communication interface, three 16-bit programmable timers, various system resets supported by the M8C low voltage detection and power-on reset. The merits of each system resource are listed here:

- The I<sup>2</sup>C slave/SPI master-slave module provides 50/100/400 kHz communication over two wires. SPI communication over three or four wires runs at speeds of 46.9 kHz to 3 MHz (lower for a slower system clock).
- The I<sup>2</sup>C hardware address recognition feature reduces the already low power consumption by eliminating the need for CPU intervention until a packet addressed to the target device is received.
- The I<sup>2</sup>C enhanced slave interface appears as a 32-byte RAM buffer to the external I<sup>2</sup>C master. Using a simple predefined protocol, the master controls the read and write pointers into the RAM. When this method is enabled, the slave does not stall the bus when receiving data bytes in active mode. For more details, refer to the [I2CSBUF User Module datasheet](#).
- Low-voltage detection (LVD) interrupts can signal the application of falling voltage levels, while the advanced power-on reset (POR) circuit eliminates the need for a system supervisor.
- An internal reference provides an absolute reference for capacitive sensing.
- A register-controlled bypass mode allows the user to disable the LDO regulator.

## Getting Started

The quickest way to understand PSoC silicon is to read this datasheet and then use the PSoC Designer Integrated Development Environment (IDE). This datasheet is an overview of the PSoC integrated circuit and presents specific pin, register, and electrical specifications.

For in depth information, along with detailed programming details, see the [Technical Reference Manual](#) for the CY8C20x37/47/67/S PSoC devices.

For up-to-date ordering, packaging, and electrical specification information, see the latest PSoC device datasheets on the web at [www.cypress.com/psoc](http://www.cypress.com/psoc).

## Application Notes/Design Guides

Application notes and design guides are an excellent introduction to the wide variety of possible PSoC designs. They are located at [www.cypress.com/gocapsense](http://www.cypress.com/gocapsense). Select Application Notes under the Related Documentation tab.

## Development Kits

PSoC Development Kits are available online from Cypress at [www.cypress.com/shop](http://www.cypress.com/shop) and through a growing number of regional and global distributors, which include Arrow, Avnet, Digi-Key, Farnell, Future Electronics, and Newark. See “[Development Kits](#)” on page 32.

## Training

Free PSoC and CapSense technical training (on demand, webinars, and workshops) is available online at [www.cypress.com/training](http://www.cypress.com/training). The training covers a wide variety of topics and skill levels to assist you in your designs.

## CYPros Consultants

Certified PSoC Consultants offer everything from technical assistance to completed PSoC designs. To contact or become a PSoC Consultant go to [www.cypress.com/cypros](http://www.cypress.com/cypros).

## Solutions Library

Visit our growing library of solution focused designs at [www.cypress.com/solutions](http://www.cypress.com/solutions). Here you can find various application designs that include firmware and hardware design files that enable you to complete your designs quickly.

## Technical Support

For assistance with technical issues, search KnowledgeBase articles and forums at [www.cypress.com/support](http://www.cypress.com/support). If you cannot find an answer to your question, create a technical support case or call technical support at 1-800-541-4736.

## Designing with PSoC Designer

The PSoC development process can be summarized in the following four steps:

1. Select [User Modules](#)
2. Configure User Modules
3. Organize and Connect
4. Generate and Verify

### Select Components

PSoC Designer provides a library of pre-built, pre-tested hardware peripheral components called "user modules". User modules make selecting and implementing peripheral devices, both analog and digital, simple.

### Configure Components

Each of the User Modules you select establishes the basic register settings that implement the selected function. They also provide parameters and properties that allow you to tailor their precise configuration to your particular application. The user module parameters permit you to establish the pulse width and duty cycle. Configure the parameters and properties to correspond to your chosen application. Enter values directly or by selecting values from drop-down menus. All the user modules are documented in datasheets that may be viewed directly in PSoC Designer or on the Cypress website. These [user module datasheets](#) explain the internal operation of the User Module and provide performance specifications. Each datasheet describes the use of each user module parameter, and other information you may need to successfully implement your design.

## Organize and Connect

You build signal chains at the chip level by interconnecting user modules to each other and the I/O pins. You perform the selection, configuration, and routing so that you have complete control over all on-chip resources.

## Generate, Verify, and Debug

When you are ready to test the hardware configuration or move on to developing code for the project, you perform the "Generate Configuration Files" step. This causes PSoC Designer to generate source code that automatically configures the device to your specification and provides the software for the system. The generated code provides application programming interfaces (APIs) with high-level functions to control and respond to hardware events at run time and interrupt service routines that you can adapt as needed.

A complete code development environment allows you to develop and customize your applications in C, assembly language, or both.

## Pinouts

The CY8C20x37/47/67/S PSoC device is available in a variety of packages, which are listed and illustrated in the following tables. Every port pin (labeled with a "P") is capable of digital I/O and connection to the common analog bus. However,  $V_{SS}$ ,  $V_{DD}$ , and XRES are not capable of digital I/O.

#### Notes

- 13 GPIOs = 10 pins for capacitive sensing+2 pins for I<sup>2</sup>C + 1 pin for modulator capacitor.
- On Power-up, the SDA(P1[0]) drives a strong high for 256 sleep clock cycles and drives resistive low for the next 256 sleep clock cycles. The SCL(P1[1]) line drives resistive low for 512 sleep clock cycles and both the pins transition to High impedance state. On reset, after XRES de-asserts, the SDA and the SCL lines drive resistive low for 8 sleep clock cycles and transition to high impedance state. In both cases, a pull-up resistance on these lines combines with the pull-down resistance (5.6K ohm) and form a potential divider. Hence, during power-up or reset event, P1[1] and P1[0] may disturb the I2C bus. Use alternate pins if you encounter issues.
- Alternate SPI clock.
- The internal pull down is 5KOhm.
- All VSS pins should be brought out to one common GND plane.

Notes

25. The center pad (CP) on the QFN package must be connected to ground (V<sub>SS</sub>) for best mechanical, thermal, and electrical performance. If not connected to ground, it must be electrically floated and not connected to any other signal.
26. 28 GPIOs = 25 pins for capacitive sensing+2 pins for I<sup>2</sup>C + 1 pin for modulator capacitor.
27. On Power-up, the SDA(P1[0]) drives a strong high for 256 sleep clock cycles and drives resistive low for the next 256 sleep clock cycles. The SCL(P1[1]) line drives resistive low for 512 sleep clock cycles and both the pins transition to High impedance state. On reset, after XRES de-asserts, the SDA and the SCL lines drive resistive low for 8 sleep clock cycles and transition to high impedance state. In both cases, a pull-up resistance on these lines combines with the pull-down resistance (5.6K ohm) and form a potential divider. Hence, during power-up or reset event, P1[1] and P1[0] may disturb the I2C bus. Use alternate pins if you encounter issues.
28. Alternate SPI clock.
29. The internal pull down is 5KOhm.
30. All VSS pins should be brought out to one common GND plane.

## Electrical Specifications

This section presents the DC and AC electrical specifications of the CY8C20x37/47/67/S PSoC devices. For the latest electrical specifications, confirm that you have the most recent datasheet by visiting the web at <http://www.cypress.com/psoc>.

### Absolute Maximum Ratings

Exceeding maximum ratings may shorten the useful life of the device. User guidelines are not tested.

**Table 7. Absolute Maximum Ratings**

Symbol	Description	Conditions	Min	Typ	Max	Units
T <sub>STG</sub>	Storage temperature	Higher storage temperatures reduce data retention time. Recommended Storage Temperature is +25 °C ± 25 °C. Extended duration storage temperatures above 85 °C degrades reliability.	-55	+25	+125	°C
V <sub>DD</sub>	Supply voltage relative to V <sub>SS</sub>	–	-0.5	–	+6.0	V
V <sub>IO</sub>	DC input voltage	–	V <sub>SS</sub> - 0.5	–	V <sub>DD</sub> + 0.5	V
V <sub>IOZ</sub>	DC voltage applied to tristate	–	V <sub>SS</sub> - 0.5	–	V <sub>DD</sub> + 0.5	V
I <sub>MIO</sub>	Maximum current into any port pin	–	-25	–	+50	mA
ESD	Electro static discharge voltage	Human body model ESD	2000	–	–	V
LU	Latch up current	In accordance with JESD78 standard	–	–	200	mA

### Operating Temperature

**Table 8. Operating Temperature**

Symbol	Description	Conditions	Min	Typ	Max	Units
T <sub>A</sub>	Ambient temperature	–	-40	–	+85	°C
T <sub>C</sub>	Commercial temperature range	–	0	–	70	°C
T <sub>J</sub>	Operational die temperature	The temperature rise from ambient to junction is package specific. See the <a href="#">Thermal Impedances on page 31</a> . The user must limit the power consumption to comply with this requirement.	-40	–	+100	°C

## DC Chip-Level Specifications

Table 9 lists guaranteed maximum and minimum specifications for the entire voltage and temperature ranges.

**Table 9. DC Chip-Level Specifications**

Symbol	Description	Conditions	Min	Typ	Max	Units
$V_{DD}$ [37, 38, 39]	Supply voltage	See Table 14 on page 17.	1.71	–	5.50	V
$I_{DD24}$	Supply current, IMO = 24 MHz	Conditions are $V_{DD} \leq 3.0$ V, $T_A = 25$ °C, CPU = 24 MHz. CapSense running at 12 MHz, no I/O sourcing current	–	2.88	4.00	mA
$I_{DD12}$	Supply current, IMO = 12 MHz	Conditions are $V_{DD} \leq 3.0$ V, $T_A = 25$ °C, CPU = 12 MHz. CapSense running at 12 MHz, no I/O sourcing current	–	1.71	2.60	mA
$I_{DD6}$	Supply current, IMO = 6 MHz	Conditions are $V_{DD} \leq 3.0$ V, $T_A = 25$ °C, CPU = 6 MHz. CapSense running at 6 MHz, no I/O sourcing current	–	1.16	1.80	mA
$I_{SB0}$ [40, 41, 42, 43]	Deep sleep current	$V_{DD} \leq 3.0$ V, $T_A = 25$ °C, I/O regulator turned off	–	0.10	1.1	μA
$I_{SB1}$ [40, 41, 42, 43]	Standby current with POR, LVD and sleep timer	$V_{DD} \leq 3.0$ V, $T_A = 25$ °C, I/O regulator turned off	–	1.07	1.50	μA
$I_{SB12C}$ [40, 41, 42, 43]	Standby current with I <sup>2</sup> C enabled	Conditions are $V_{DD} = 3.3$ V, $T_A = 25$ °C and CPU = 24 MHz	–	1.64	–	μA

### Notes

37. When  $V_{DD}$  remains in the range from 1.71 V to 1.9 V for more than 50 μs, the slew rate when moving from the 1.71 V to 1.9 V range to greater than 2 V must be slower than 1 V/500 μs to avoid triggering POR. The only other restriction on slew rates for any other voltage range or transition is the  $SR_{POWER\_UP}$  parameter.
38. If powering down in standby sleep mode, to properly detect and recover from a  $V_{DD}$  brown out condition any of the following actions must be taken:
  - a. Bring the device out of sleep before powering down.
  - b. Assure that  $V_{DD}$  falls below 100 mV before powering back up.
  - c. Set the No Buzz bit in the OSC\_CR0 register to keep the voltage monitoring circuit powered during sleep.
  - d. Increase the buzz rate to assure that the falling edge of  $V_{DD}$  is captured. The rate is configured through the PSSDC bits in the SLP\_CFG register. For the referenced registers, refer to the [Technical Reference Manual](#). In deep sleep/standby sleep mode, additional low power voltage monitoring circuitry allows  $V_{DD}$  brown out conditions to be detected and resets the device when  $V_{DD}$  goes lower than 1.1 V at edge rates slower than 1 V/ms.
39. For proper CapSense block functionality, if the drop in  $V_{DD}$  exceeds 5% of the base  $V_{DD}$ , the rate at which  $V_{DD}$  drops should not exceed 200 mV/s. Base  $V_{DD}$  can be between 1.8 V and 5.5 V.
40. **Errata:** When programmable timer 0 is used in “one-shot” mode by setting bit 1 of register 0,B0h (PT0\_CFG), and the timer interrupt is used to wake the device from sleep, the interrupt service routine (ISR) may be executed twice. For more information, see the “[Errata](#)” on page 38.
41. **Errata:** When in sleep mode, if a GPIO interrupt happens simultaneously with a Timer0 or Sleep Timer interrupt, the GPIO interrupt may be missed, and the corresponding GPIO ISR not run. For more information, see the “[Errata](#)” on page 38.
42. **Errata:** If an interrupt is posted a short time (within 2.5 CPU cycles) before firmware commands the device to sleep, the interrupt will be missed. For more information, see the “[Errata](#)” on page 38.
43. **Errata:** Device wakes up from sleep when an analog interrupt is trigger. For more information, see the “[Errata](#)” on page 38.

## DC GPIO Specifications

The following tables list guaranteed maximum and minimum specifications for the voltage and temperature ranges: 3.0 V to 5.5 V and  $-40\text{ }^{\circ}\text{C} \leq T_A \leq 85\text{ }^{\circ}\text{C}$ , 2.4 V to 3.0 V and  $-40\text{ }^{\circ}\text{C} \leq T_A \leq 85\text{ }^{\circ}\text{C}$ , or 1.71 V to 2.4 V and  $-40\text{ }^{\circ}\text{C} \leq T_A \leq 85\text{ }^{\circ}\text{C}$ , respectively. Typical parameters apply to 5 V and 3.3 V at 25 °C and are for design guidance only.

**Figure 11. Definition for Timing for Fast/Standard Mode on the I<sup>2</sup>C Bus**

**Notes**

- 55. Errata: To wake up from sleep using I2C hardware address match event, I2C interface needs 20 ns hold time on SDA line with respect to falling edge of SCL. For more information see item #5 in the "Errata" on page 38.
- 56. A Fast-Mode I<sup>2</sup>C-bus device can be used in a standard mode I<sup>2</sup>C-bus system, but the requirement t<sub>SU;DAT</sub> ≥ 250 ns must then be met. This automatically be the case if the device does not stretch the LOW period of the SCL signal. If such device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line t<sub>rmax</sub> + t<sub>SU;DAT</sub> = 1000 + 250 = 1250 ns (according to the Standard-Mode I<sup>2</sup>C-bus specification) before the SCL line is released.

### Packaging Information

This section illustrates the packaging specifications for the CY8C20x37/47/67 PSoC device, along with the thermal impedances for each package.

**Important Note** Emulation tools may require a larger area on the target PCB than the chip's footprint. For a detailed description of the emulation tools' dimensions, refer to the document titled *PSoC Emulator Pod Dimensions* at <http://www.cypress.com/design/MR10161>.

### Notes

57.  $T_J = T_A + \text{Power} \times \theta_{JA}$ .

58. To achieve the thermal impedance specified for the QFN package, the center thermal pad must be soldered to the PCB ground plane.

## Development Tool Selection

### Software

#### *PSoC Designer™*

At the core of the PSoC development software suite is PSoC Designer, used to generate PSoC firmware applications. PSoC Designer is a Microsoft® Windows-based, integrated development environment for the Programmable System-on-Chip (PSoC) devices. The PSoC Designer IDE and application runs on Windows XP and Windows Vista.

This system provides design database management by project, in-system programming support, and built-in support for third-party assemblers and C compilers. PSoC Designer also supports C language compilers developed specifically for the devices in the PSoC family. PSoC Designer is available free of charge at <http://www.cypress.com/psocdesigner> and includes a free C compiler.

#### *PSoC Designer Software Subsystems*

You choose a base device to work with and then select different onboard analog and digital components called user modules that use the PSoC blocks. Examples of user modules are ADCs, DACs, Amplifiers, and Filters. You configure the user modules for your chosen application and connect them to each other and to the proper pins. Then you generate your project. This prepopulates your project with APIs and libraries that you can use to program your application.

The tool also supports easy development of multiple configurations and dynamic reconfiguration. Dynamic reconfiguration allows for changing configurations at run time. Code Generation Tools PSoC Designer supports multiple third-party C compilers and assemblers. The code generation tools work seamlessly within the PSoC Designer interface and have been tested with a full range of debugging tools. The choice is yours.

**Assemblers.** The assemblers allow assembly code to be merged seamlessly with C code. Link libraries automatically use absolute addressing or are compiled in relative mode, and linked with other software modules to get absolute addressing.

**C Language Compilers.** C language compilers are available that support the PSoC family of devices. The products allow you to create complete C programs for the PSoC family devices. The optimizing C compilers provide all the features of C tailored to the PSoC architecture. They come complete with embedded libraries providing port and bus operations, standard keypad and display support, and extended math functionality.

#### *PSoC Programmer*

PSoC Programmer is flexible enough and is used on the bench in development and is also suitable for factory programming. PSoC Programmer works either as a standalone programming application or operates directly from PSoC Designer. PSoC Programmer software is compatible with both PSoC ICE Cube in-circuit Emulator and PSoC MiniProg. PSoC programmer is available free of cost at <http://www.cypress.com/psocprogrammer>.

### Development Kits

All development kits are sold at the [Cypress Online Store](#).

### Evaluation Tools

All evaluation tools are sold at the [Cypress Online Store](#).

#### *CY3210-MiniProg1*

The **CY3210-MiniProg1** kit allows you to program PSoC devices through the MiniProg1 programming unit. The MiniProg is a small, compact prototyping programmer that connects to the PC through a provided USB 2.0 cable. The kit includes:

- MiniProg programming unit
- MiniEval socket programming and evaluation board
- 28-pin CY8C29466-24PXI PDIP PSoC device sample
- 28-pin CY8C27443-24PXI PDIP PSoC device sample
- PSoC Designer software CD
- Getting Started guide
- USB 2.0 cable

#### *CY3210-PSoCEval1*

The **CY3210-PSoCEval1** kit features an evaluation board and the MiniProg1 programming unit. The evaluation board includes an LCD module, potentiometer, LEDs, and plenty of bread-boarding space to meet all of your evaluation needs. The kit includes:

- Evaluation board with LCD module
- MiniProg programming unit
- Two 28-pin CY8C29466-24PXI PDIP PSoC device samples
- PSoC Designer software CD
- Getting Started guide
- USB 2.0 cable

## Device Programmers

All device programmers are purchased from the [Cypress Online Store](#).

### *CY3216 Modular Programmer*

The [CY3216 Modular Programmer kit](#) features a modular programmer and the MiniProg1 programming unit. The modular programmer includes three programming module cards and supports multiple Cypress products. The kit includes:

- Modular programmer base
- Three programming module cards
- MiniProg programming unit
- PSoC Designer software CD
- Getting Started guide
- USB 2.0 cable

## Third Party Tools

Several tools have been specially designed by the following third-party vendors to accompany PSoC devices during development and production. Specific details for each of these tools can be found at <http://www.cypress.com> under Documentation > Evaluation Boards.

### *CY3207ISSP In-System Serial Programmer (ISSP)*

The [CY3207ISSP](#) is a production programmer. It includes protection circuitry and an industrial case that is more robust than the MiniProg in a production-programming environment.

**Note** CY3207ISSP needs special software and is not compatible with PSoC Programmer. The kit includes:

- CY3207 programmer unit
- PSoC ISSP software CD
- 110 ~ 240 V power supply, Euro-Plug adapter
- USB 2.0 cable

**Table 36. Acronyms Used in this Document**

Acronym	Description
AC	alternating current
ADC	analog-to-digital converter
API	application programming interface
CMOS	complementary metal oxide semiconductor
CPU	central processing unit
DAC	digital-to-analog converter
DC	direct current
ESD	electrostatic discharge
FSR	full scale range
GPIO	general purpose input/output
I <sup>2</sup> C	inter-integrated circuit
ICE	in-circuit emulator
ILO	internal low speed oscillator
IMO	internal main oscillator
I/O	input/output
ISSP	in-system serial programming
LCD	liquid crystal display
LDO	low dropout (regulator)
LED	light-emitting diode
LPC	low power comparator
LSB	least-significant bit
LVD	low voltage detect
MCU	micro-controller unit
MIPS	million instructions per second
MISO	master in slave out
MOSI	master out slave in
MSB	most-significant bit
OCD	on-chip debug
PCB	printed circuit board
POR	power on reset
PSRR	power supply rejection ratio
PWRSYS	power system
PSoC	programmable system-on-chip
QFN	quad flat no-lead
SCLK	serial I <sup>2</sup> C clock
SDA	serial I <sup>2</sup> C data
SDATA	serial ISSP data

### Units of Measure

Table 37 lists all the abbreviations used to measure the PSoC devices.

**Table 37. Units of Measure**

Symbol	Unit of Measure
°C	degree Celsius
dB	decibel
kHz	kilohertz
ksps	kilo samples per second
kΩ	kilohm
MHz	megahertz
μA	microampere
μs	microsecond
mA	milliampere
mm	millimeter
ms	millisecond
mV	millivolt
nA	nanoampere
ns	nanosecond
Ω	ohm
%	percent
pF	picofarad
V	volt
W	watt

## Numeric Naming

Hexadecimal numbers are represented with all letters in uppercase with an appended lowercase 'h' (for example, '14h' or '3Ah'). Hexadecimal numbers may also be represented by a '0x' prefix, the C coding convention. Binary numbers have an appended lowercase 'b' (for example, '01010100b' or '01000011b'). Numbers not indicated by an 'h', 'b', or 0x are decimal.

## Glossary

Crosspoint connection	Connection between any GPIO combination via analog multiplexer bus.
Differential non linearity	Ideally, any two adjacent digital codes correspond to output analog voltages that are exactly one LSB apart. Differential non-linearity is a measure of the worst case deviation from the ideal 1 LSB step.
Hold time	Hold time is the time following a clock event during which the data input to a latch or flip-flop must remain stable in order to guarantee that the latched data is correct.
I <sup>2</sup> C	It is a serial multi-master bus used to connect low speed peripherals to MCU.
Integral nonlinearity	It is a term describing the maximum deviation between the ideal output of a DAC/ADC and the actual output level.
Latch-up current	Current at which the latch-up test is conducted according to JESD78 standard (at 125 degree Celsius)
Power supply rejection ratio (PSRR)	The PSRR is defined as the ratio of the change in supply voltage to the corresponding change in output voltage of the device.
Scan	The conversion of all sensor capacitances to digital values.
Setup time	Period required to prepare a device, machine, process, or system for it to be ready to function.
Signal-to-noise ratio	The ratio between a capacitive finger signal and system noise.
SPI	Serial peripheral interface is a synchronous serial data link standard.

## Errata

This section describes the errata for the CY8C20xx7/S family. Details include errata trigger conditions, scope of impact, available workaround, and silicon revision applicability.

### CY8C20xx7/S Qualification Status

Product Status: Production released.

### CY8C20xx7/S Errata Summary

The following Errata items apply to the CY8C20xx7/S datasheet 001-69257.

#### 1. DoubleTimer0 ISR

##### ■ Problem Definition

When programmable timer 0 is used in “one-shot” mode by setting bit 1 of register 0, B0h (PT0\_CFG), and the timer interrupt is used to wake the device from sleep, the interrupt service routine (ISR) may be executed twice.

##### ■ Parameters Affected

No datasheet parameters are affected.

##### ■ Trigger Condition(S)

Triggered by enabling one-shot mode in the timer, and using the timer to wake from sleep mode.

##### ■ Scope of Impact

The ISR may be executed twice.

##### ■ Workaround

In the ISR, firmware should clear the one-shot bit with a statement such as “`and reg[B0h], FDh`”

##### ■ Fix Status

Will not be fixed

##### ■ Changes

None

#### 2. Missed GPIO Interrupt

##### ■ Problem Definition

When in sleep mode, if a GPIO interrupt happens simultaneously with a Timer0 or Sleep Timer interrupt, the GPIO interrupt may be missed, and the corresponding GPIO ISR not run.

##### ■ Parameters Affected

No datasheet parameters are affected.

##### ■ Trigger Condition(S)

Triggered by enabling sleep mode, then having GPIO interrupt occur simultaneously with a Timer 0 or Sleep Timer interrupt.

##### ■ Scope of Impact

The GPIO interrupt service routine will not be run.

##### ■ Workaround

The system should be architected such that a missed GPIO interrupt may be detected. For example, if a GPIO is used to wake the system to perform some function, the system should detect if the function is not performed, and re-issue the GPIO interrupt. Alternatively, if a GPIO interrupt is required to wake the system, then firmware should disable the Sleep Timer and Timer0. Alternatively, the ISR's for Sleep Timer and Timer0 should manually check the state of the GPIO to determine if the host system has attempted to generate a GPIO interrupt.

##### ■ Fix Status

Will not be fixed

##### ■ Changes

None

### 3. Missed Interrupt During Transition to Sleep

#### ■ Problem Definition

If an interrupt is posted a short time (within 2.5 CPU cycles) before firmware commands the device to sleep, the interrupt will be missed.

#### ■ Parameters Affected

No datasheet parameters are affected.

#### ■ Trigger Condition(S)

Triggered by enabling sleep mode just prior to an interrupt.

#### ■ Scope of Impact

The relevant interrupt service routine will not be run.

#### ■ Workaround

None.

#### ■ Fix Status

Will not be fixed

#### ■ Changes

None

### 4. Wakeup from sleep with analog interrupt

#### ■ Problem Definition

Device wakes up from sleep when an analog interrupt is trigger

#### ■ Parameters Affected

No datasheet parameters are affected.

#### ■ Trigger Condition(S)

Triggered by enabling analog interrupt during sleep mode when device operating temperature is 50 °C or above

#### ■ Scope of Impact

Device unexpectedly wakes up from sleep

#### ■ Workaround

Disable the analog interrupt before entering sleep and turn it back on upon wake-up.

#### ■ Fix Status

Will not be fixed

#### ■ Changes

None

**5. Wake-up from Sleep with Hardware I2C Address match on Pins P1[0], P1[1]**

■ **Problem Definition**

I2C interface needs 20 ns hold time on SDA line with respect to falling edge of SCL, to wake-up from sleep using I2C hardware address match event.

■ **Parameters Affected**

$t_{HD;DAT}$  increased to 20 ns from 0 ns

■ **Trigger Condition(S)**

This is an issue only when all these three conditions are met:

- 1) P1.0 and P1.1 are used as I2C pins,
- 2) Wakeup from sleep with hardware address match feature is enabled, and
- 3) I2C master does not provide 20 ns hold time on SDA with respect to falling edge of SCL.

■ **Scope of Impact**

These trigger conditions cause the device to never wake-up from sleep based on I2C address match event.

■ **Workaround**

For a design that meets all of the trigger conditions, the following suggested circuit has to be implemented as a work-around. The R and C values proposed are 100 ohm and 200 pF respectively.

■ **Fix Status**

Will not be fixed

■ **Changes**

None

## 6. I2C Port Pin Pull-up Supply Voltage

### ■ Problem Definition

Pull-up resistor on I2C interface cannot be connected to a supply voltage that is greater than 0.7 V of CY8C20xx7/S  $V_{DD}$ .

### ■ Parameters Affected

None.

### ■ Trigger Condition(S)

This problem occurs only when the I2C master is powered at a higher voltage than CY8C20xx7/S.

### ■ Scope of Impact

This trigger condition will corrupt the I2C communication between the I2C host and the CY8C20xx7/S CapSense controller.

### ■ Workaround

I2C master cannot be powered at a supply voltage that is greater than 0.7 V compared to CY8C20xx7/S supply voltage.

### ■ Fix Status

Will not be fixed

### ■ Changes

None

## 7. Port1 Pin Voltage

### ■ Problem Definition

Pull-up resistor on port1 pins cannot be connected to a voltage that is greater than 0.7 V higher than CY8C20xx7/S  $V_{DD}$ .

### ■ Parameters Affected

None.

### ■ Trigger Condition(S)

This problem occurs only when port1 pins are at voltage 0.7 V higher than  $V_{DD}$  of CY8C20xx7/S.

### ■ Scope of Impact

This trigger condition will not allow CY8C20xx7/S to drive the output signal on port1 pins, input path is unaffected by this condition.

### ■ Workaround

Port1 should not be connected to a higher voltage than  $V_{DD}$  of CY8C20xx7/S.

### ■ Fix Status

Will not be fixed

### ■ Changes

None
