Bi-CMOS IC

Fan Motor Driver

Single-Phase Full-Wave Driver

## Overview

The LV8068V is single-phase bipolar fan motor is driven, through BTL output linear driver, at high efficiency, low power, and low noise by suppressing the reactive power. The BTL output can put PWM control by an outside signal together, which is optimum for the CPU cooler, etc.

## Functions

- Single-phase full-wave operating by BTL output (BTL amplifier gain : +49dB)
- Speed control available by PWM input
- The characteristic of the motor rotational speed adjust by "VCONT" voltage
- The characteristic of the motor rotational minimum speed adjust by "RMI" voltage
- Hall bias output terminal (VHB = 1.32V (typ))
- Built-in Quick Start circuit
- Startup support function (50% Duty Start)
- FG (rotate detection) output terminal (Open drain output)
- RD (Lock detection) output terminal (Open drain output)
- Built-in Current Limiter circuit (limit at  $I_O = 250\text{mA}$  with  $R_f = 1$  connection, the limiter value determined with  $R_f$ .)
- Built-in lock protection and automatic return circuit
- Built-in thermal shut-down (TSD) circuit

## Specifications

### Maximum Ratings at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Maximum supply voltage	V <sub>CC</sub> max		18	V
OUT pin output current	I <sub>OUT</sub> max	In regular mode	1.2	A
OUT pin output voltage handling	V <sub>OUT</sub> max		18	V
RD output voltage handling	V <sub>RD</sub> max		18	V
RD output current	I <sub>RD</sub> max		5	mA
FG output voltage handling	V <sub>FG</sub> max		18	V
FG output current	I <sub>FG</sub> max		5	mA
HB output current	I <sub>HB</sub> max		10	mA
PWM input voltage handling	V <sub>PWM</sub> max		7	V
Allowable power dissipation	P <sub>d</sub> max	IC On board*	0.8	W
Operating temperature	T <sub>opr</sub>		-40 to +90	°C
Storage temperature	T <sub>stg</sub>		-55 to +150	°C

\* Specified board : 114.3mm × 76.1mm × 1.6mm, glass epoxy board

Caution 1) Absolute maximum ratings represent the values which cannot be exceeded for any length of time.

Caution 2) Even when the device is used within the range of absolute maximum ratings, as a result of continuous usage under high temperature, high current, high voltage, or drastic temperature change, the reliability of the IC may be degraded. Please contact us for the further details.

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

### Recommended Operating Conditions at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Operating supply voltage1	V <sub>CC</sub> op1	Active at all circuit	6.0 to 16.0	V
Operating supply voltage2	V <sub>CC</sub> op2	Start-up with PWM=H and RMI=VCONT=L	4.0 to 6.0	V
Hall input common-mode input voltage range	V <sub>ICM</sub>		0.3 to 5VREG-1.5	V
VCONT input voltage range	V <sub>CONTIN</sub>		0.3 to 5VREG	V
RMI input voltage range	V <sub>RMIIN</sub>		0.3 to 5VREG	V
PWM input frequency range	F <sub>PWMIN</sub>		20 to 50	kHz

## Sample Application Circuit

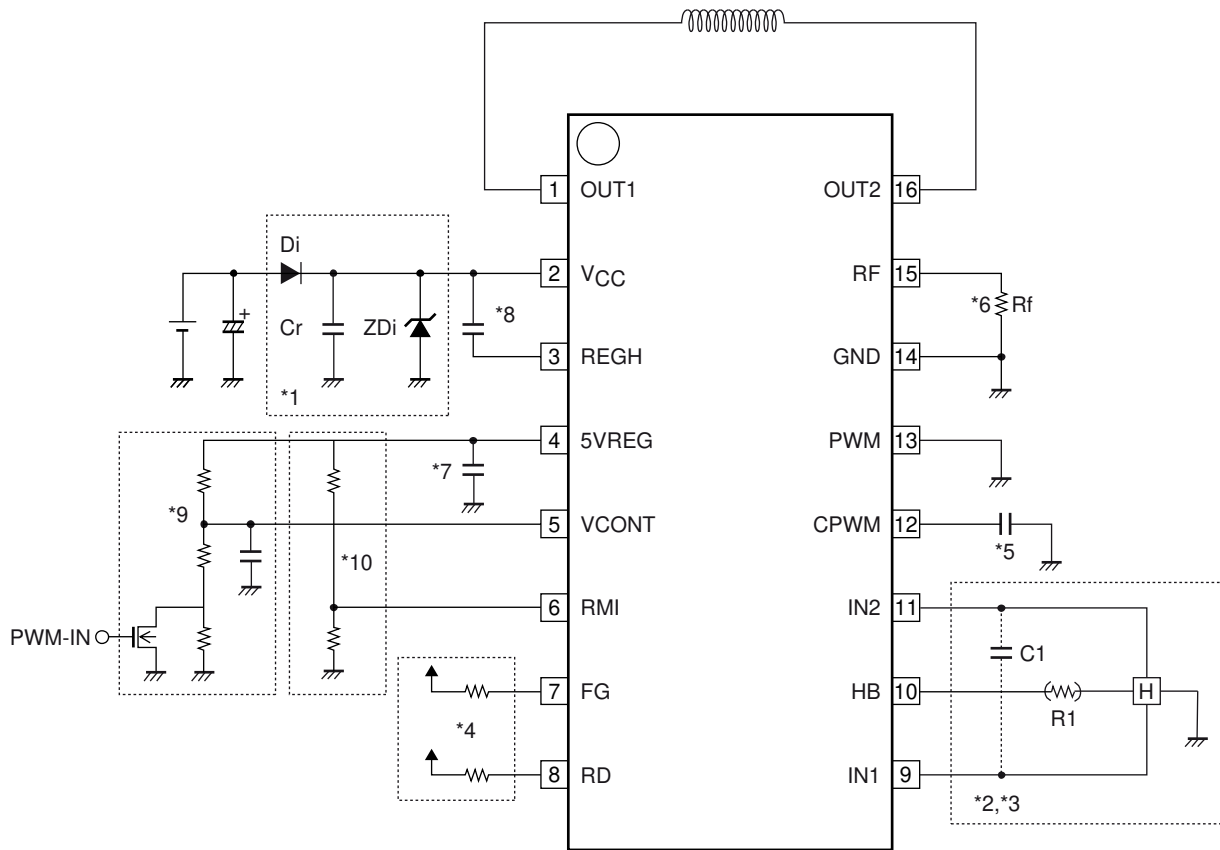

### 1. Speed control by PWM pin

- \*1 When the diode Di is used to prevent device destruction from reverse connection, the capacitor Cr must be inserted to assure a path for regenerative currents.  
Similarly, if there no nearby capacitors on the fan power supply line, the capacitor Cr is also required to increase reliability. When a protection diode against reverse connection is used, if supply voltage increases due to coil kickback, connect zener diode between power supply and GND.
- \*2 The Hall element is biased at a constant voltage of approximately 1.3V from the HB pin. Thus the LV8068V provides a stable Hall output with excellent temperature characteristics. If the Hall output is needed to adjust the amplitude, use the resistor R1 as shown in the figure.
- \*3 When the wiring from the Hall output to IC Hall input is long, noise may be carried through the wiring. In this case, insert the capacitor C1 as shown in the figure.
- \*4 FG/RD pin is open collector (drain) output. This pin must be left open if unused.
- \*5 It is a capacitor for PWM oscillations. (Cpwm = 100pF, fpwm = about 33kHz (typ))
- \*6 The current limiter is activated when the voltage between current detection resistor exceeds 0.25V between GND and RF. The current limiter is activated at  $I_O = 250\text{mA}$  when  $R_L = 1\Omega$ . Setting is made with the Rf resistance. Short-circuit GND and RF when the current-limiter PWM is not to be used.
- \*7 Please insert enough capacitor value between GND and RGL for stabilization on a terminal.
- \*8 Please insert enough capacitor value between Vcc and RGH for stabilization on a terminal.

- \*7 Please insert enough capacitor value between GND and RGL for stabilization on a terminal.
- \*8 Please insert enough capacitor value between Vcc and RGH for stabilization on a terminal.
- \*9 VCONT is speed control pin. For the control method ,refer to the timing chart.
- \*10 RMI is minimum speed setting pin. When you do not use RMI, please make pull-up to 5VREG

1. Stand-by/Start-up

\*TSLP = 400μs (typ)

\*When PWM signal is input “L” level for continuousness TSLP, it becomes the Stand-by mode by detecting above situation.

\*When “H” level is input, it becomes the Active mode at once.
