RENESAS LOW-VOLTAGE OCTAL BUS SWITCH

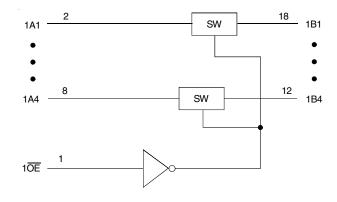

FEATURES:

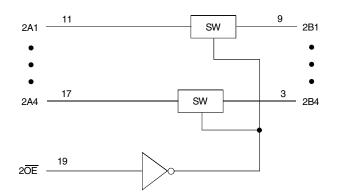

- · Pin-out compatible with standard '244 Logic products
- 5Ω A/B bi-directional switch
- · Isolation under power-off conditions
- · Over-voltage tolerant
- Latch-up performance exceeds 100mA
- Vcc = 2.3V 3.6V, Normal Range
- ESD > 2000V per MIL-STD-883, Method 3015;
 > 200V using machine model (C = 200pF, R = 0)
- Available in QSOP and TSSOP packages

APPLICATIONS:

· 3.3V High Speed Bus Switching and Bus Isolation

FUNCTIONAL BLOCK DIAGRAM

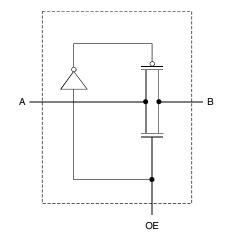

DESCRIPTION:

The octal bus switch has standard 244 pinouts. The CBTLV3244 is designed for asynchronous communication between data buses. Sets of four switches are controlled by one output Enable (\overline{OE}). When \overline{OE} is low, the set of four bus switches is on and port A is connected to port B. When \overline{OE} is high, the set of four bus switches is off and a high impedance exists between port A and port B.

To ensure the high-impedance state during power up or power down, both $\overline{OE}s$ should be tied to Vcc through a pullup resistor.

NOTE:

 Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

NOTES:

1. The increase in supply current is attributable to each current that is at the specified voltage level rather than Vcc or GND.

2. This is measured by the voltage drop between the A and B terminals at the indicated current through the switch.
