

# DAC1403D160

Dual 14 bits DAC, up to 160 MHz, 2 x interpolating

Rev. 03 — 2 July 2012

Product data sheet

## 1. General description

---

The DAC1403D160 is optimized to reduce architecture complexity and overall system cost. It leads to dynamic performance in multi-carrier support, because of its direct IF conversion capabilities. With an internal sampling rate of up to 160 MHz, DAC1403D160 is an extremely competitive solution for broadband wireless systems transmitters, as well as a wide range of applications.

## 2. Features

---

- Dual 14-bit resolution
- Spurious-Free Dynamic Range (SFDR) = 80 dBc at 2.5 MHz
- Input data rate up to 80 MHz
- 2 × interpolation filter
- Output data rate up to 160 MHz
- Single 3.3 V power supply
- Low noise capacitor-free integrated Phase-Locked Loop (PLL)
- Low power dissipation
- HTQFP80 package
- Ambient temperature from -40 °C to +85 °C

## 3. Applications

---

- Broadband wireless systems
- Digital radio links
- Cellular base stations
- Instrumentation
- Cable modem
- Cable Modem Termination System (CMTS)/Data Over Cable Service Interface Specification (DOCSIS)

## 7. Functional description

The Digital-to-Analog Converter (DAC) is a segmented architecture composed of a 7-bit thermometer sub-DAC and the remaining 7-bit in a binary weighted sub-DAC.

The device produces two complementary current outputs on both channels, respectively pins IOUT/IOUTN and QOUT/QOUTN which need to be connected via a load resistor to the ground.

Figure 3 shows the equivalent analog output circuit of one DAC, which consists of a parallel combination of PMOS current sources and associated switches for each segment.

The cascade source configuration enables the increasing of the output impedance of the source and set to improve the dynamic performance of the DAC by introducing less distortion.

Figure 4 shows the internal reference configuration. In this case the bias current is given by the output of the internal regulator connected to the inverting input of the internal operational amplifiers, while external resistors  $R_I$  and  $R_Q$  are connected respectively to pins IVIRES and QVIRES. Thus the output current of the two DACs is typically fixed to 20 mA with an appropriate choice of these resistors. This configuration is optimal for temperature drift compensation because the band gap can be matched with the voltage on the feedback resistors.

The relation between full-scale output current  $I_{O(fs)}$  and the  $R_I$  ( $R_Q$ ) is:

$$R_I = \frac{2048 \times V_{GAPOUT}}{82 \times I_{O(fs)}} \Omega$$

The output current can also be adjusted by imposing an external reference voltage to the inverting input pin GAPOUT and disabling the internal band gap with pin GAPD set to HIGH. At a voltage lower than 1.2 V the current can be set at values lower than 20 mA. The input references at pins IVIRES and QVIRES may also be driven by separate reference voltages to adjust independently the two DAC currents.

## 14. Glossary

### 14.1 Static parameters

**DNL** — Differential Non-Linearity. The difference between the ideal and the measured output value between successive DAC codes.

**INL** — Integral Non-Linearity. The deviation of the transfer function from a best-fit straight line (linear regression computation).

### 14.2 Dynamic parameters

**IMD2** — Second-order intermodulation distortion. From a dual-tone digital input sine wave (these two frequencies are close together), the intermodulation distortion product IMD2 is the ratio of the RMS value of either tone and the RMS value of the worst 2nd-order intermodulation product.

**IMD3** — Third-order intermodulation distortion. From a dual-tone digital input sine wave (these two frequencies are close together), the intermodulation distortion product IMD3 is the ratio of the RMS value of either tone and the RMS value of the worst 3rd-order intermodulation product.

**S/N** — Signal-to-Noise ratio. The ratio of the RMS value of the reconstructed output sine wave to the RMS value of the noise excluding the harmonics and the DC component.

**THD** — Total Harmonic Distortion. The ratio of the RMS value of the harmonics of the output frequency to the RMS value of the output sine wave. Usually, the calculation of THD is done on the first 5 harmonics.

**SFDR** — Spurious-Free Dynamic Range. The ratio of the RMS value of the reconstructed output sine wave and the RMS value of the largest spurious (harmonic and non-harmonic, excluding DC component) observed in the frequency domain.
