Warnings

Due to technical requirements, components may contain dangerous substances. For information on the types in question, please contact the nearest Infineon Technologies Office.

Infineon Technologies components may be used in life-support devices or systems only with the express written approval of Infineon Technologies, if a failure of such components can reasonably be expected to cause the failure of that life-support device or system or to affect the safety or effectiveness of that device or system. Life support devices or systems are intended to be implanted in the human body or to support and/or maintain and sustain and/or protect human life. If they fail, it is reasonable to assume that the health of the user or other persons may be endangered.

1 Summary of Features

The TC27x product family has the following features:

- High Performance Microcontroller with three CPU cores
- Two 32-bit super-scalar TriCore CPUs (TC1.6P), each having the following features:
 - Superior real-time performance
 - Strong bit handling
 - Fully integrated DSP capabilities
 - Multiply-accumulate unit able to sustain 2 MAC operations per cycle
 - Fully pipelined Floating point unit (FPU)
 - up to 200 MHz operation at full temperature range
 - up to 120 Kbyte Data Scratch-Pad RAM (DSPR)
 - up to 32 Kbyte Instruction Scratch-Pad RAM (PSPR)
 - 16 Kbyte Instruction Cache (ICACHE)
 - 8 Kbyte Data Cache (DCACHE)
- Power Efficient scalar TriCore CPU (TC1.6E), having the following features:
 - Binary code compatibility with TC1.6P
 - up to 200 MHz operation at full temperature range
 - up to 112 Kbyte Data Scratch-Pad RAM (DSPR)
 - up to 24 Kbyte Instruction Scratch-Pad RAM (PSPR)
 - 8 Kbyte Instruction Cache (ICACHE)
 - 0.125Kbyte Data Read Buffer (DRB)
- Lockstepped shadow cores for one TC1.6P and for TC1.6E
- Multiple on-chip memories
 - All embedded NVM and SRAM are ECC protected
 - up to 4 Mbyte Program Flash Memory (PFLASH)
 - up to 384 Kbyte Data Flash Memory (DFLASH) usable for EEPROM emulation
 - 32 Kbyte Memory (LMU)
 - BootROM (BROM)
- 64-Channel DMA Controller with safe data transfer
- Sophisticated interrupt system (ECC protected)
- High performance on-chip bus structure
 - 64-bit Cross Bar Interconnect (SRI) giving fast parallel access between bus masters, CPUs and memories
 - 32-bit System Peripheral Bus (SPB) for on-chip peripheral and functional units
 - One bus bridge (SFI Bridge)
- Optional Hardware Security Module (HSM) on some variants
- Safety Management Unit (SMU) handling safety monitor alarms
- Memory Test Unit with ECC, Memory Initialization and MBIST functions (MTU)
- Hardware I/O Monitor (IOM) for checking of digital I/O
- Versatile On-chip Peripheral Units
 - Four Asynchronous/Synchronous Serial Channels (ASCLIN) with hardware LIN support (V1.3, V2.0, V2.1 and J2602) up to 50 MBaud

Summary of Features

- Four Queued SPI Interface Channels (QSPI) with master and slave capability up to 50 Mbit/s
- High Speed Serial Link (HSSL) for serial inter-processor communication up to 320 Mbit/s
- Two serial Micro Second Bus interfaces (MSC) for serial port expansion to external power devices
- One MultiCAN+ Module with 4 CAN nodes and 256 free assignable message objects for high efficiency data handling via FIFO buffering and gateway data transfer
- 10 Single Edge Nibble Transmission (SENT) channels for connection to sensors
- One FlexRay™ module with 2 channels (E-Ray) supporting V2.1
- One Generic Timer Module (GTM) providing a powerful set of digital signal filtering and timer functionality to realize autonomous and complex Input/Output management
- One Capture / Compare 6 module (Two kernels CCU60 and CCU61)
- One General Purpose 12 Timer Unit (GPT120)
- Three channel Peripheral Sensor Interface conforming to V1.3 (PSI5)
- Peripheral Sensor Interface with Serial PHY (PSI5-S)
- Optional Inter-Integrated Circuit Bus Interface (I2C) conforming to V2.1
- Optional IEEE802.3 Ethernet MAC with RMII and MII interfaces (ETH)
- Versatile Successive Approximation ADC (VADC)
 - Cluster of 8 independent ADC kernels
 - Input voltage range from 0 V to 5.5V (ADC supply)
- Delta-Sigma ADC (DSADC)
 - Six channels
- Digital programmable I/O ports
- On-chip debug support for OCDS Level 1 (CPUs, DMA, On Chip Buses)
- multi-core debugging, real time tracing, and calibration
- four/five wire JTAG (IEEE 1149.1) or DAP (Device Access Port) interface
- Power Management System and on-chip regulators
- Clock Generation Unit with System PLL and Flexray PLL
- Embedded Voltage Regulator

Ordering Information

The ordering code for Infineon microcontrollers provides an exact reference to the required product. This ordering code identifies:

- The derivative itself, i.e. its function set, the temperature range, and the supply voltage
- The package and the type of delivery.

For the available ordering codes for the TC270 / TC275 / TC277 please refer to the “**AURIX TC27x Microcontrollers Variant Overview**”, which summarizes all available variants.

- 1) Address range starts at lowest address defined in the User's Manual. For reference see the Memory Maps chapter of the User's Manual.
- 2) To ensure the processor cores are provided with a constant stream of instructions the Instruction Fetch Units will speculatively fetch instructions from the up to 64 bytes ahead of the current PC.
If the current PC is within 64 bytes of the top of an instruction memory the Instruction Fetch Unit may attempt to speculatively fetch instruction from beyond the physical range. This may then lead to error conditions and alarms being triggered by the bus and memory systems.
It is therefore recommended that the upper 64 bytes of any memory be unused for instruction storage.

2 Package and Pinning Definitions

This chapter gives a pinning of the different packages of the TC270 / TC275 / TC277.

2.1.2 Emergency Stop Function

The Emergency Stop function can be used to force GPIOs (General Purpose Inputs/Outputs) via an external input signal (EMGSTOPA or EMGSTOPB) into a defined state:

- Input state and
- PU or High-Z depending on HWCFG[6] level latched during $\overline{\text{PORST}}$ active

Control of the Emergency Stop function:

1) The default state of GPIOs (Px.y) during and after $\overline{\text{PORST}}$ active is controlled via HWCFG[6] (P14.4). HWCFG[6] has a weak internal pull-up active at start-up if the pin is left unconnected. See also User's Manual, "Introduction Chapter", "General Purpose I/O Ports and Peripheral I/O Lines", Figure: "Default state of port pins during and after reset".

2) If HWCFG[6] is left unconnected or is externally pulled high, weak internal pull-ups (PU1) / pull-downs (PD1) are active during and after reset.

3) If HWCFG[6] is connected to ground, the PD1 / PU1 pins are predominantly in HighZ during and after reset.

Package and Pinning Definitions TC275x Pin Definition and Functions:

- The Emergency Stop function can be enabled/disabled in the SCU (see chapter “SCU”, “Emergency Stop Control”)
- The Emergency Stop input signal, EMGSTOPA (P33.8) / EMGSTOPB (P21.2) , can selected in the SCU (see chapter “SCU”, “Emergency Stop Control”)
- On port level, each GPIO can be enabled/disabled for the Emergency Stop function via the Px_ESR (Port x Emergency Stop) registers in the port control logic (see chapter “General Purpose I/O Ports and Peripheral I/O Lines”, “Emergency Stop Register”).

The Emergency Stop function is available for all GPIO Ports with the following exceptions:

- Not available for P20.2 (General Purpose Input/GPI only, overlaid with Testmode)
- Not available for P40.x (analog input ANx overlaid with GPI)
- Not available for P32.0 EVR13 SMPS mode.
- Not available for dedicated I/O without General Purpose Output function (e.g ESRx, TMS, TCK)

The Emergency Stop function can be overruled on the following GPIO Ports:

- P00.x: Emergency Stop can be overruled by the VADC. Overruling can be disabled via the control register P00_SCR (see chapter “General Purpose I/O Ports and Peripheral I/O Lines”, P00)
- P14.0 and P14.1: Emergency Stop can be overruled in the DXCPL mode (DAP over can physical layer mode). No Overruling in the DXCM (Debug over can message) mode
- P21.6: Emergency Stop can be overruled in JTAG mode if this pin is used as TDI
- P21.7: Emergency Stop can be overruled in JTAG or Three Pin DAP mode
- P20.0: Emergency Stop can be overruled in JTAG mode if this GPIO is used as TDI

2.1.3 Pull-Up/Pull-Down Reset Behavior of the Pins

Table 2-18 List of Pull-Up/Pull-Down Reset Behavior of the Pins

| Pins | PORST = 0 | PORST = 1 |
|---------------------|---|------------------------------------|
| all GPIOs | Pull-up if HWCFG[6] = 1 or High-Z if HWCFG[6] = 0 | |
| TDI, TESTMODE | Pull-up | |
| PORST ¹⁾ | Pull-down with I_{PORST} relevant | Pull-down with I_{PDLI} relevant |
| TRST, TCK, TMS | Pull-down | |
| ESR0 | The open-drain driver is used to drive low. ²⁾ | Pull-up ³⁾ |
| ESR1 | Pull-up ³⁾ | |
| TDO | Pull-up | High-Z/Pull-up ⁴⁾ |

1) Pull-down with I_{PORST} relevant is always activated when a primary supply monitor detects a violation.

2) Valid additionally after deactivation of \overline{PORST} until the internal reset phase has finished. See the SCU chapter for details.

3) See the SCU_IOCRR register description.

4) Depends on JTAG/DAP selection with \overline{TRST} .

In case of leakage test ($\overline{PORST} = 0$ and $\overline{TESTMODE} = 0$), the pull-down of the \overline{TRST} pin is switched off. In case of an user application ($\overline{TESTMODE} = 1$), the pull-down of the \overline{TRST} is always switched on.

2.2.2 Emergency Stop Function

The Emergency Stop function can be used to force GPIOs (General Purpose Inputs/Outputs) via an external input signal (EMGSTOPA or EMGSTOPB) into a defined state:

- Input state and
- PU or High-Z depending on HWCFG[6] level latched during $\overline{\text{PORST}}$ active

Control of the Emergency Stop function:

- The Emergency Stop function can be enabled/disabled in the SCU (see chapter “SCU”, “Emergency Stop Control”)
- The Emergency Stop input signal, EMGSTOPA (P33.8) / EMGSTOPB (P21.2), can selected in the SCU (see chapter “SCU”, “Emergency Stop Control”)
- On port level, each GPIO can be enabled/disabled for the Emergency Stop function via the Px_ESR (Port x Emergency Stop) registers in the port control logic (see chapter “General Purpose I/O Ports and Peripheral I/O Lines”, “Emergency Stop Register”).

The Emergency Stop function is available for all GPIO Ports with the following exceptions:

- Not available for P20.2 (General Purpose Input/GPI only, overlaid with Testmode)
- Not available for P40.x (analog input ANx overlaid with GPI)
- Not available for P32.0 EVR13 SMPS mode.
- Not available for dedicated I/O without General Purpose Output function (e.g ESRx, TMS, TCK)

The Emergency Stop function can be overruled on the following GPIO Ports:

- P00.x: Emergency Stop can be overruled by the VADC. Overruling can be disabled via the control register P00_SCR (see chapter “General Purpose I/O Ports and Peripheral I/O Lines”, P00)
- P14.0 and P14.1: Emergency Stop can be overruled in the DXCPL mode (DAP over can physical layer mode). No Overruling in the DXCM (Debug over can message) mode
- P21.6: Emergency Stop can be overruled in JTAG mode if this pin is used as TDI
- P21.7: Emergency Stop can be overruled in JTAG or Three Pin DAP mode

2) If HWCFG[6] is left unconnected or is externally pulled high, weak internal pull-ups (PU1) / pull-downs (PD1) are active during and after reset.

3) If HWCFG[6] is connected to ground, the PD1 / PU1 pins are predominantly in HighZ during and after reset.

Package and Pinning Definitions TC277x Pin Definition and Functions:

- P20.0: Emergency Stop can be overruled in JTAG mode if this GPIO is used as TDI

2.2.3 Pull-Up/Pull-Down Reset Behavior of the Pins

Table 2-39 List of Pull-Up/Pull-Down Reset Behavior of the Pins

| Pins | $\overline{\text{PORST}} = 0$ | $\overline{\text{PORST}} = 1$ |
|--|---|---|
| all GPIOs | Pull-up if HWCFG[6] = 1 or High-Z if HWCFG[6] = 0 | |
| $\overline{\text{TDI}}$, $\overline{\text{TESTMODE}}$ | Pull-up | |
| $\overline{\text{PORST}}^{1)}$ | Pull-down with I_{PORST} relevant | Pull-down with I_{PDLI} relevant |
| $\overline{\text{TRST}}$, TCK, TMS | Pull-down | |
| $\overline{\text{ESR0}}$ | The open-drain driver is used to drive low. ²⁾ | Pull-up ³⁾ |
| $\overline{\text{ESR1}}$ | Pull-up ³⁾ | |
| $\overline{\text{TDO}}$ | Pull-up | High-Z/Pull-up ⁴⁾ |

1) Pull-down with I_{PORST} relevant is always activated when a primary supply monitor detects a violation.

2) Valid additionally after deactivation of $\overline{\text{PORST}}$ until the internal reset phase has finished. See the SCU chapter for details.

3) See the SCU_IOCRR register description.

4) Depends on JTAG/DAP selection with $\overline{\text{TRST}}$.

In case of leakage test ($\overline{\text{PORST}} = 0$ and $\overline{\text{TESTMODE}} = 0$), the pull-down of the $\overline{\text{TRST}}$ pin is switched off. In case of an user application ($\overline{\text{TESTMODE}} = 1$), the pull-down of the $\overline{\text{TRST}}$ is always switched on.

2.3 TC270x Bare Die Pad Definition

The TC270x Bare Die Logic Symbol is shown in [Figure 2-3](#).

[Table 2-40](#) describes the pads of the TC270x Bare Die. It describes also the mapping of VADC / DS-ADC channels to the analog inputs (ANx) and the mapping of Port functions to the pads.

Note: The detailed description of the port functions (Px.y) can be found in the User's Manual chapter "General Purpose I/O Ports and Peripheral I/O Lines (Ports)".

2.3.1 Pad Openings

Two different pad openings are used:

- Standard Pad Opening is 70um x 75um where 70um is the width of the opening (width as seen from the die side) and 75um is the depth of the opening (from the die side into the silicon).
- Double Pad or Elephant Pad Opening is 130um x 75um where 130um is the width of the opening (width as seen from the die side) and 75um is the depth of the opening (from the die side into the silicon). The Double Pad openings are represented with two opening coordinates and two pad numbers. Double Pads are used only for supply and can be identified by the words 'Double Pad' or 'Elephant Pad' in the Comment column.

2.3.2 Emergency Stop Function

The Emergency Stop function can be used to force GPIOs (General Purpose Inputs/Outputs) via an external input signal (EMGSTOPA or EMGSTOPB) into a defined state:

1) The default state of GPIOs (Px.y) during and after $\overline{\text{PORST}}$ active is controlled via HWCFG[6] (P14.4). HWCFG[6] has a weak internal pull-up active at start-up if the pin is left unconnected. See also User's Manual, "Introduction Chapter", "General Purpose I/O Ports and Peripheral I/O Lines", Figure: "Default state of port pins during and after reset".

2) If HWCFG[6] is left unconnected or is externally pulled high, weak internal pull-ups are active at GPIOs (Px.y) pins during and after reset. Exceptions are P33.8 (HighZ), P40.x (default configuration during and after reset: analog inputs, port input function disabled), ESR0, P21.6 / P21.7 (port pins overlaid with JTAG functionality).

3) If HWCFG[6] is connected to ground, port pins are predominantly in HighZ during and after reset. Exceptions are P33.8 (HighZ), P40.x (default configuration during and after reset: analog inputs, port input function disabled), ESR0, P21.6 / P21.7 (port pins overlaid with JTAG functionality).

- Input state and
- PU or HighZ depending on HWCFG[6] level latched during $\overline{\text{PORST}}$ active

Control of the Emergency Stop function:

- The Emergency Stop function can be enabled/disabled in the SCU (see chapter “SCU”, “Emergency Stop Control”)
- The Emergency Stop input signal, EMGSTOPA (P33.8) / EMGSTOPB (P21.2), can be selected in the SCU (see chapter “SCU”, “Emergency Stop Control”)
- On port level, each GPIO can be enabled/disabled for the Emergency Stop function via the Px_ESR (Port x Emergency Stop) registers in the port control logic (see chapter “General Purpose I/O Ports and Peripheral I/O Lines”, “Emergency Stop Register”).

The Emergency Stop function is available for all GPIO Ports with the following exceptions:

- Not available for P20.2 (General Purpose Input/GPI only, overlaid with Testmode)
- Not available for P40.x (analog input ANx overlaid with GPI)
- Not available for P32.0 EVR13 SMPS mode.
- Not available for dedicated I/O without General Purpose Output function (e.g ESRx, TMS, TCK)

The Emergency Stop function can be overruled on the following GPIO Ports:

- P00.x: Emergency Stop can be overruled by the VADC. Overruling can be disabled via the control register P00_SCR (see chapter “General Purpose I/O Ports and Peripheral I/O Lines”, P00)
- P14.0 and P14.1: Emergency Stop can be overruled in the DXCPL mode (DAP over can physical layer mode). No Overruling in the DXCM (Debug over can message) mode
- P21.6: Emergency Stop can be overruled in JTAG mode if this pin is used as TDI
- P21.7: Emergency Stop can be overruled in JTAG or Three Pin DAP mode
- P20.0: Emergency Stop can be overruled in JTAG mode if this GPIO is used as TDI

2.3.3 Pull-Up/Pull-Down Reset Behavior of the Pins

Table 2-41 List of Pull-Up/Pull-Down Reset Behavior of the Pins

| Pins | $\overline{\text{PORST}} = 0$ | $\overline{\text{PORST}} = 1$ |
|--|---|---|
| all GPIOs | Pull-up if HWCFG[6] = 1 or High-Z if HWCFG[6] = 0 | |
| $\overline{\text{TDI}}$, $\overline{\text{TESTMODE}}$ | Pull-up | |
| $\overline{\text{PORST}}^{1)}$ | Pull-down with I_{PORST} relevant | Pull-down with I_{PDLI} relevant |
| $\overline{\text{TRST}}$, TCK, TMS | Pull-down | |
| $\overline{\text{ESR0}}$ | The open-drain driver is used to drive low. ²⁾ | Pull-up ³⁾ |
| $\overline{\text{ESR1}}$ | Pull-up ³⁾ | |
| TDO | Pull-up | High-Z/Pull-up ⁴⁾ |

1) Pull-down with I_{PORST} relevant is always activated when a primary supply monitor detects a violation.

2) Valid additionally after deactivation of $\overline{\text{PORST}}$ until the internal reset phase has finished. See the SCU chapter for details.

3) See the SCU_IOCRR register description.

4) Depends on JTAG/DAP selection with $\overline{\text{TRST}}$.

- In case of leakage test ($\overline{\text{PORST}} = 0$ and $\overline{\text{TESTMODE}} = 0$), the pull-down of the $\overline{\text{TRST}}$ pin is switched off. In case of an user application ($\overline{\text{TESTMODE}} = 1$), the pull-down of the $\overline{\text{TRST}}$ is always switched on.

3 Electrical Specification

3.1 Parameter Interpretation

The parameters listed in this section partly represent the characteristics of the TC270 / TC275 / TC277 and partly its requirements on the system. To aid interpreting the parameters easily when evaluating them for a design, they are marked with an two-letter abbreviation in column "Symbol":

- **CC**
Such parameters indicate **C**ontroller **C**haracteristics which are a distinctive feature of the TC270 / TC275 / TC277 and must be regarded for a system design.
- **SR**
Such parameters indicate **S**ystem **R**equirements which must provided by the microcontroller system in which the TC270 / TC275 / TC277 designed in.

3.2 Absolute Maximum Ratings

Stresses above the values listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the Operational Conditions of this specification is not implied. Exposure to absolute maximum rating conditions may affect device reliability.

Table 3-1 Absolute Maximum Ratings

| Parameter | Symbol | Values | | | Unit | Note / Test Condition |
|--|--------------------|--------|------|---|------|---|
| | | Min. | Typ. | Max. | | |
| Storage Temperature | T_{ST} SR | -65 | - | 170 | °C | upto 65h @ $T_J = 150^\circ\text{C}$; upto 15h @ $T_J = 170^\circ\text{C}$ |
| Voltage at V_{DD} power supply pins with respect to V_{SS} ¹⁾ | V_{DD} SR | - | - | 1.9 | V | |
| Voltage at V_{DDP3} and V_{DDFL3} power supply pins with respect to V_{SS} ¹⁾ | V_{DDP3} SR | - | - | 4.43 | V | |
| Voltage at V_{DDM} , V_{EXT} and V_{FLEX} power supply pins with respect to V_{SS} ¹⁾ | V_{DDM} SR | - | - | 7.0 | V | |
| Voltage on any class A2 and LVDSH input pin with respect to V_{SS} ¹⁾²⁾ | V_{IN} SR | -0.5 | - | min($V_{DDP3} +$ 0.6 , 4.23) | V | Whatever is lower |
| Voltage on all other input pins with respect to V_{SS} ¹⁾²⁾ | V_{IN} SR | -0.5 | - | 7.0 | V | |
| Input current on any pin during overload condition ³⁾ | I_{IN} SR | -10 | - | 10 | mA | |
| Absolute maximum sum of all input circuit currents during overload condition ³⁾ | ΣI_{IN} SR | -100 | - | 100 | mA | |

- 1) Valid for cumulated for up to 2.8h and pulse forms following a power supply switch on phase, where the rise and fall times are related to the system capacities and coils.
- 2) Voltages below V_{INmin} have no impact to the device reliability as long as the times and currents defined in section Pin Reliability in Overload for the affected pad(s) are not violated.
- 3) This parameter is an Absolute Maximum Rating. Exposure to Absolute Maximum Ratings for extended periods of time may damage the device.

3.3 Pin Reliability in Overload

When receiving signals from higher voltage devices, low-voltage devices experience overload currents and voltages that go beyond their own IO power supplies specification.

The following table defines overload conditions that will not cause any negative reliability impact if all the following conditions are met:

- full operation life-time is not exceeded
- **Operating Conditions** are met for
 - pad supply levels
 - temperature

If a pin current is out of the **Operating Conditions** but within the overload parameters, then the parameters functionality of this pin as stated in the Operating Conditions can no longer be guaranteed. Operation is still possible in most cases but with relaxed parameters.

Note: An overload condition on one or more pins does not require a reset.

Table 3-2 Overload Parameters

| Parameter | Symbol | Values | | | Unit | Note / Test Condition |
|--|------------------|-------------------|------|--------------------|------|---|
| | | Min. | Typ. | Max. | | |
| Input current on any digital pin during overload condition | I_{IN} | -5 | - | 5 | mA | except LVDS pins |
| | | -15 ¹⁾ | - | 15 ¹⁾ | mA | except LVDS pins; limited to max. 20 pulses with 1ms pulse length |

- 1) Reduced VADC / DSADC result accuracy and / or GPIO input levels (V_{IL} and V_{IH}) can differ from specified parameters.
- 2) Limitations for time and supply levels specified in this section are not valid for this parameter.
- 3) Overload is measured as increase of pad leakage caused by injection on neighbor pad.
- 4) For analogue inputs overlaid with DSADC function the VCM holdbuffer shall be enabled, in case DSADCs are enabled.

Note: DSADC input pins count as analog pins as they are overlaid with VADC pins.

3.4 Operating Conditions

The following operating conditions must not be exceeded in order to ensure correct operation and reliability of the TC270 / TC275 / TC277. All parameters specified in the following tables refer to these operating conditions, unless otherwise noticed.

Digital supply voltages applied to the TC270 / TC275 / TC277 must be static regulated voltages.

All parameters specified in the following tables refer to these operating conditions (see table below), unless otherwise noticed in the Note / Test Condition column.

1) Hysteresis is implemented to avoid metastable states and switching due to internal ground bounce. It can't be guaranteed that it suppresses switching due to external system noise.

2) For currents smaller than the $I_{OL/OH}$ from the test condition the defined Max. value stays unchanged.

3) Rise / fall times are defined 10% - 90% of $V_{EXT/FLEX}$.

4) $V_{IHx} = 0.27 \cdot V_{EXT/FLEX} + 0.545\text{V}$

5) $V_{ILx} = 0.17 \cdot V_{EXT/FLEX}$

6) The values are only valid if the pad is not used during operation, otherwise I_{SC} defines the limits for operation.

3.7 High performance LVDS Pads (LVDSH)

This LVDS pad type is used for the high speed chip to chip communication interface of the new TC270 / TC275 / TC277. It compose out of a LVDSH pad and a Class F pad.

This pad combination is always supplied by the 3.3V supply rail.

3.8 Medium performance LVDS Pads (LVDSM)

This LVDS pad type is used for the medium speed chip to chip communication interface of the new TC270 / TC275 / TC277. It compose out of a LVDSM pad and a MP pad.

This pad combination is always supplied by the 5V or 3.3V.

For the parameters of the MP pad please see [Chapter 3.5](#).

- 1) If the reference voltage is reduced by the factor k ($k < 1$), TUE, DNL, INL, Gain, and Offset errors increase also by the factor $1/k$. V_{AREF} must be decoupled with an external capacitor.
- 2) For $QCONV = X \text{ pC}$ and a conversion time of $1 \text{ } \mu\text{s}$ a rms value of $X \text{ } \mu\text{A}$ results for I_{AREFX} .
- 3) For the details of the mapping for a VADC group to pin V_{AREFX} please see the User's Manual.
- 4) The broken wire detection delay against V_{AGND} is measured in numbers of consecutive precharge cycles at a conversion rate higher than 1 conversion per 500 ms.
- 5) The broken wire detection delay against V_{AREF} is measured in numbers of consecutive precharge cycles at a conversion rate higher than 1 conversion per 10 ms. This function is influenced by leakage current, in particular at high temperature.
- 6) Resulting worst case combined error is arithmetic combination of TUE and EN_{RMS} .
- 7) This parameter is valid for soldered devices and requires careful analog board design.
- 8) Value is defined for one sigma Gauss distribution.
- 9) In order to avoid an additional error due to incomplete sampling, the sampling time shall be set greater than $5 \cdot R_{CSD} \cdot C_{AINS}$.
- 10) The pull-down resistor R_{PDD} is connected between the input pad and the analog multiplexer. The input pad itself adds another 200-Ohm series resistance, when measuring through the pin.
- 11) CSD: Converter Self Diagnostics, for details please consult the User's Manual.
- 12) Note, that in case CSD voltage is chosen to nom. 1/3 or 2/3 of V_{AREF} voltage, the reference voltage is loaded with a current of max. $V_{AREF} / 45 \text{ kOhm}$.

The following VADC parameter are valid for $V_{DDM} = 2.97 \text{ V}$ to 3.63 V .

3.11 MHz Oscillator

OSC_XTAL is used as accurate and exact clock source. OSC_XTAL supports 8 MHz to 40 MHz crystals external outside of the device. Support of ceramic resonators is also provided.

1) t_{OSCS} is defined from the moment when $V_{DDP3} = 3.13\text{V}$ until the oscillations reach an amplitude at XTAL1 of $0.3 * V_{DDP3}$. The external oscillator circuitry must be optimized by the customer and checked for negative resistance as recommended and specified by crystal suppliers.

2) This value depends on the frequency of the used external crystal. For faster crystal frequencies this value decrease.

Note: It is strongly recommended to measure the oscillation allowance (negative resistance) in the final target system (layout) to determine the optimal parameters for the oscillator operation. Please refer to the limits specified by the crystal or ceramic resonator supplier.

3.12 Back-up Clock

The back-up clock provides an alternative clock source.

3.14 Power Supply Current

The total power supply current defined below consists of leakage and switching component.

Application relevant values are typically lower than those given in the following table and depend on the customer's system operating conditions (e.g. thermal connection or used application configurations).

The operating conditions for the parameters in the following table are:

The real (realistic) power pattern defines the following conditions:

- $T_J = 150\text{ °C}$
- $f_{SRI} = f_{MAX} = f_{CPU0} = 200\text{ MHz}$
- $f_{SPB} = f_{STM} = f_{GTM} = f_{BAUD1} = f_{BAUD2} = f_{ASCLIN} = 40\text{ MHz}$
- $V_{DD} = 1.326\text{ V}$
- $V_{DDP3} = 3.366\text{ V}$
- $V_{EXT/FLEX} = V_{DDM} = 5.1\text{ V}$
- all cores are active including one lockstep core
- the following peripherals are inactive: HSM, HSCT, Ethernet, PSI5, I2C, FCE, MTU, and 50% of the DSADC channels

The max power pattern defines the following conditions:

- $T_J = 150\text{ °C}$
- $f_{SRI} = f_{MAX} = f_{CPU0} = 200\text{ MHz}$
- $f_{SPB} = f_{STM} = f_{GTM} = f_{BAUD1} = f_{BAUD2} = f_{ASCLIN} = 100\text{ MHz}$
- $V_{DD} = 1.43\text{ V}$
- $V_{DDP3} = 3.63\text{ V}$
- $V_{EXT/FLEX} = V_{DDM} = 5.5\text{ V}$
- all cores and lockstep cores are active
- all peripherals are active

- 1) Realistic Pflash read pattern with 70% Pflash bandwidth utilization and a code mix of 50% 0s and 50% 1s. A common decoupling capacitor of at least 100nF for ($V_{DDFL3} + V_{DDP3}$) is used. Dflash read current is also included. Flash read current is predominantly drawn from V_{DDFL3} pin and a minor part drawn from the neighbouring V_{DDP3} pin.
- 2) Continuous Dflash programming in burst mode with 3.3 V supply and realistic Pflash read access in parallel. Erase currents of the corresponding flash modules are less than the respective programming currents at V_{DDP3} pin. Programming and erasing flash may generate transient current spikes of up to x mA for maximum x us which is handled by the decoupling and buffer capacitors. This parameter is relevant for external power supply dimensioning and not for thermal considerations.
- 3) In addition to the current specified, upto 4 mA is additionally drawn at V_{EXT} supply in burst programming mode with 5V external supply. Erase currents of the corresponding flash modules are less than the respective programming currents at V_{DDP3} supply. This parameter is relevant for external power supply dimensioning and not for thermal considerations.

- 4) The current consumption is for 2 pairs of LVDSM differential pads (8 pins). A single pair of LVDSM differential pads (4 pins) consumes 7 mA.
- 5) The current consumption is for 6 DS channels with standard performance (MCFG=11b). A single DS channel instance consumes 6-8 mA.
- 6) A single converter instance of VADC unit consumes 2 mA.
- 7) The total current drawn from external regulator is estimated with 72% EVR13 SMPS regulator Efficiency. $I_{DDTOTDC}$ is calculated from I_{DDTOT} using the scaled core current $[(I_{DD} \times V_{DD}) / (V_{in} \times \text{Efficiency})]$ and constitutes all other rail currents and I_{DDM} .
- 8) Current at $V_{EVR_{RSB}}$ supply pin during normal RUN mode is less than 5 mA at $T_j = 150$ degC. The transition between RUN mode to STANDBY mode has a duration of less than 100us during which the current is higher but is less than 8 mA at $T_j = 150$ degC. Once STANDBY mode is entered with only Standby RAM active the current is less than 5mA at $T_j = 150$ degC. It is recommended to have atleast 100 nF decoupling capacitor at this pin.

3.14.1 Calculating the 1.3 V Current Consumption

The current consumption of the 1.3 V rail compose out of two parts:

- Static current consumption
- Dynamic current consumption

The static current consumption is related to the device temperature T_j and the dynamic current consumption depends of the configured clocking frequencies and the software application executed. These two parts needs to be added in order to get the rail current consumption.

(3.2)

$$I_0 = 1,135 \left[\frac{\text{mA}}{\text{C}} \right] \times e^{0,02689 \times T_j[\text{C}]}$$

(3.3)

$$I_0 = 3,264 \left[\frac{\text{mA}}{\text{C}} \right] \times e^{0,0259 \times T_j[\text{C}]}$$

Function 2 defines the typical static current consumption and Function 3 defines the maximum static current consumption. Both functions are valid for $V_{DD} = 1.326$ V.

3.15 Power-up and Power-down

3.15.1 External Supply Mode

5 V & 1.3 V supplies are externally supplied. 3.3V is generated internally by EVR33.

- External supplies VEXT and VDD may ramp-up or ramp-down independent of each other with regards to start, rise and fall time(s). Voltage Ramp-up from a residual threshold (Eg : up to 1 V) should also lead to a normal startup of the device.
- The rate at which current is drawn from the external regulator (dI_{EXT}/dt or dI_{DD}/dt) is limited in the Start-up phase to a maximum of 50 mA/100 us.
- PORST is active/asserted when either PORST (input) or PORST (output) is active/asserted.
- PORST (input) active means that the reset is held active by external agents by pulling the PORST pin low. It is recommended to keep the PORST (input) asserted until all the external supplies are above their primary reset thresholds.
- PORST (output) active means that μC asserts the reset internally and drives the PORST pin low thus propagating the reset to external devices. The PORST (output) is asserted by the μC when atleast one among the three supply domains (1.3 V, 3.3 V or 5 V) violate their primary under-voltage reset thresholds. The PORST (output) is deasserted by the μC when all supplies are above their primary reset thresholds and the basic supply and clock infrastructure is available.
- The power sequence as shown in [Figure 3-3](#) is enumerated below
 - T1 refers to the point in time when basic supply and clock infrastructure is available as the external supplies ramp up. The supply mode is evaluated based on the HWCFG [0:2] pins and consequently a soft start of EVR33 regulator is initiated.
 - T2 refers to the point in time when all supplies are above their primary reset thresholds. EVR33 regulator has ramped up. PORST (output) is deasserted and HWCFG [0:7] pins are latched on PORST rising edge. Firmware execution is initiated.
 - T3 refers to the point in time when Firmware execution is completed. User code execution starts with a default frequency of 100 MHz.
 - T4 refers to the point in time during the Ramp-down phase when atleast one of the externally provided or generated supplies (1.3 V, 3.3 V or 5 V) drop below their respective primary under-voltage reset thresholds.

Please note that there is no special requirements for \overline{PORST} slew rates.

3.15.2 Single Supply Mode

5 V single supply mode. 1.3 V & 3.3 V are generated internally by EVR13 & EVR33.

- The rate at which current is drawn from the external regulator (dI_{EXT}/dt) is limited in the Start-up phase to a maximum of 50 mA/100 μ s.
- PORST is active/asserted when either PORST (input) or PORST (output) is active/asserted.
- PORST (input) active means that the reset is held active by external agents by pulling the PORST pin low. It is recommended to keep the PORST (input) asserted until the external supply is above the respective primary reset threshold.
- PORST (output) active means that μ C asserts the reset internally and drives the PORST pin low thus propagating the reset to external devices. The PORST (output) is asserted by the μ C when at least one among the three supply domains (1.3 V, 3.3 V or 5 V) violate their primary under-voltage reset thresholds. The PORST (output) is deasserted by the μ C when all supplies are above their primary reset thresholds and the basic supply and clock infrastructure is available.
- The power sequence as shown in [Figure 3-4](#) is enumerated below
 - T1 refers to the point in time when basic supply and clock infrastructure is available as the external supply ramps up. The supply mode is evaluated based on the HWCFG [0:2] pins and consequently a soft start of EVR13 and EVR33 regulators are initiated.

1) The duration of the boot time is defined between the rising edge of the internal application reset and the clock cycle when the first user instruction has entered the CPU pipeline and its processing starts.

2) The timing values assumes programmed BMI with ESR0CNT inactive.

3) The duration of the boot time is defined by all external supply voltages are inside there operation condicions and the clock cycle when the first user instruction has entered the CPU pipeline and its processing starts.

Electrical Specification Reset Timing

- 4) The regulator that supplies V_{EXT} should ensure that V_{EXT} is in the operational region before PORST is externally released by the regulator. In case of 5V nominal supply, it should be ensured that $V_{EXT} > 4V$ before PORST is released. In case of 3.3V nominal supply, it should be ensured that $V_{EXT} > 3V$ before PORST is released. The additional minimum PORST hold time is required as an additional mechanism to avoid consecutive PORST toggling owing to slow supply slopes or residual supply ramp-ups. It is also required to activate external PORST at least 100us before power-fail is recognised to avoid consecutive PORST toggling on a power fail event.
- 5) This parameter includes the delay of the analog spike filter in the \overline{PORST} pad.

| Line step response | dV_{out}/dV_{in} CC | -20 | - | 20 | mV | $dV/dT=1V/ms$; pass device=on chip |

- 1) A maximum pass device dropout voltage of 700mV is included in the minimum input voltage to ensure optimal pass device operation.
- 2) It is recommended to select a capacitor with ESR less than 50 mOhm (0.5MHz - 10 MHz). It is also recommended that the resistance of the supply trace from the pin to the EVR output capacitor is less than 100 mOhm.
- 3) The reset release on supply ramp-up is delayed by a time duration 20-40 us after reaching undervoltage reset threshold. This serves as a time hysteresis to avoid multiple consecutive cold PORST events during slow supply ramp-ups owing to voltage drop/current jumps when reset is released. The reset limit of 2.97V at pin is for the case with 3.3V generated internally from EVR33. In case the 3.3V supply is provided externally, the bondwire drop will cause a reset at a higher voltage of 3.0V at the V_{DDP3} pin.
- 4) EVR robust against residual voltage ramp-up starting between 0-1 V.

Note: The specified PLL jitter values are valid if the capacitive load per pin does not exceed $C_L = 20 \text{ pF}$ with the maximum driver and sharp edge.

Note: The maximum peak-to-peak noise on the power supply voltage, is limited to a peak-to-peak voltage of $V_{\text{pp}} = 100 \text{ mV}$ for noise frequencies below 300 KHz and $V_{\text{pp}} = 40 \text{ mV}$ for noise frequencies above 300 KHz. These conditions can be achieved by appropriate blocking of the supply voltage as near as possible to the supply pins and using PCB supply and ground planes.

3.20 AC Specifications

All AC parameters are specified for the complete operating range defined in [Chapter 3.4](#) unless otherwise noted in column Note / test Condition.

Unless otherwise noted in the figures the timings are defined with the following guidelines:

3.25 QSPI Timings, Master and Slave Mode

This section defines the timings for the QSPI in the TC270 / TC275 / TC277, for 5V pad power supply. It is assumed that SCLKO, MTSR, and SLSO pads have the same pad settings:

- LVDSM output pads, LVDSH input pad, master mode, $C_L=25\text{pF}$
- Medium Performance Plus Pads (MP+):
 - strong sharp edge (MP+ss), $C_L=25\text{pF}$
 - strong medium edge (MP+sm), $C_L=50\text{pF}$
 - medium edge (MP+m), $C_L=50\text{pF}$
 - weak edge (MP+w), $C_L=50\text{pF}$
- Medium Performance Pads (MP):
 - strong sharp edge (MPss), $C_L=25\text{pF}$
 - strong medium edge (MPsm), $C_L=50\text{pF}$
- Medium and Low Performance Pads (MP/LP), the identical output strength settings:
 - medium edge (LP/MPm), $C_L=50\text{pF}$
 - weak edge (MPw), $C_L=50\text{pF}$

Note: Pad asymmetry is already included in the following timings.

1) Documented value is valid for master transmit or slave receive only. For full duplex the external SPI counterpart timing has to be taken into account.

2) The capacitive load on the LVDS pins is differential, the capacitive load on the CMOS pins is single ended.

3) The PLL jitter is not included. It should be considered additionally, corresponding to the used baudrate. The duty cycle can be adjusted using the bit fields ECONZ.A, B and C with the finest granularity of $T_{MAX} = 1 / f_{MAX}$.

4) Positive deviation lengthens the high time and shortens the low time of a clock period. Negative deviation does the opposite.

5) For compensation of the average on-chip delay the QSPI module provides the bit fields ECONZ.A, B and C.

3.26 QSPI Timings, Master and Slave Mode

This section defines the timings for the QSPI in the TC270 / TC275 / TC277, for 3.3V pad power supply. It is assumed that SCLKO, MTSR, and SLSO pads have the same pad settings:

- LVDSM output pads, LVDSH input pad, master mode, $C_L=25\text{pF}$
- Medium Performance Plus Pads (MP+):
 - strong sharp edge (MP+ss), $C_L=25\text{pF}$
 - strong medium edge (MP+sm), $C_L=50\text{pF}$
 - medium edge (MP+m), $C_L=50\text{pF}$
 - weak edge (MP+w), $C_L=50\text{pF}$
- Medium Performance Pads (MP):
 - strong sharp edge (MPss), $C_L=25\text{pF}$
 - strong medium edge (MPsm), $C_L=50\text{pF}$
- Medium and Low Performance Pads (MP/LP), the identical output strength settings:
 - medium edge (LP/MPm), $C_L=50\text{pF}$
 - weak edge (MPw), $C_L=50\text{pF}$

Note: Pad asymmetry is already included in the following timings.

- 1) Documented value is valid for master transmit or slave receive only. For full duplex the external SPI counterpart timing has to be taken into account.
 2) The PLL jitter is not included. It should be considered additionally, corresponding to the used baudrate. The duty cycle can be adjusted using the bit fields ECONz.A, B and C with the finest granularity of $T_{MAX} = 1 / f_{MAX}$.
 3) Positive deviation lengthens the high time and shortens the low time of a clock period. Negative deviation does the opposite.
 4) For compensation of the average on-chip delay the QSPI module provides the bit fields ECONz.A, B and C.
 5) The setup and hold times are valid for both settings of the input pads thresholds: TTL and AL.

1) FCLP signal rise/fall times are the rise/fall times of the LVDSM pads, and the high/low times are $\min 1 * T_A$.

2) T_A depends on the clock source selected for baud rate generation in the ABRA block of the MSC.

3) The capacitive load on the LVDS pins is differential, the capacitive load on the CMOS pins is single ended.

- 4) The PLL jitter is not included. It should be considered additionally, corresponding to the used baudrate. The duty cycle can be adjusted if the ABRA block is used.
- 5) Positive deviation lengthens the high time and shortens the low time of a clock period. Negative deviation does the opposite.
- 6) From FCLP rising edge.
- 7) When using slow and asymmetrical edges, like in case of open drain upstream connection, the application must take care that the bit is long enough (the baud rate is low enough) so that under worst case conditions the three sampling points in the middle of the bit are not violated.

Timing Options for t_{45}

The wiring shown in the **Figure 3-21** provides three useful timing options for t_{45} . depending on the signals selected with the alternate output lines (ALT1 to ALT7) in the ports:

- EN01 - FCLN, SON, EN0, EN1 - t_{45} reference timing
- EN01D - FCLND, SOND, EN0, EN1 - t_{45} window shifted to the left
- EN23 - FCLN, SON, EN2, EN3 - t_{45} window shifted to the right

The timings corresponding to EN01, EN01D, and EN23 are defined in the LVDS. In order to use the EN23 timings, the application should use the EN2 and EN3 outputs of the MSC module.

Note: Pad asymmetry is already included in the following timings.

Note: Load for LVDS pads are defined as differential loads in the following timings.

Mapping A, Combo Pads in LVDS Mode or CMOS Mode

The timing applies for the LVDS pads in LVDS operating mode:

- The LVDSM output pads for clock and data signals set in LVDS mode
- The CMOS MP pads for enable signals, with strong driver sharp edge (MPss) or strong driver medium edge (MPsm).

- 1) FCLP signal rise/fall times are the rise/fall times of the LVDSM pads, and the high/low times are $\min 1 * T_A$.
- 2) The PLL jitter is not included. It should be considered additionally, corresponding to the used baudrate. The duty cycle can be adjusted if the ABRA block is used.
- 3) Positive deviation lengthens the high time and shortens the low time of a clock period. Negative deviation does the opposite.

| Data Flash ECC Delay | t_{DFECC} CC | - | - | 20 | ns | see PMU_FCON.WSECDF |
| Program Flash access delay | t_{PF} CC | - | - | 30 | ns | see PMU_FCON.WSPFLASH |
| Program Flash ECC delay | t_{PFECC} CC | - | - | 10 | ns | see PMU_FCON.WSECPF |
| Number of erase operations on DF0 over lifetime | N_{ERD0} CC | - | - | 750000 | cycles | |
| Number of erase operations on DF1 over lifetime | N_{ERD1} CC | - | - | 500000 | cycles | |
| Junction temperature limit for PFlash program/erase operations | $T_{JPFlash}$ SR | - | - | 150 | °C | |

- 1) All typical values were characterised, but are not tested. Typical values are safe median values at room temperature
- 2) Under out-of-spec conditions (e.g. over-cycling) or in case of activation of WL oriented defects, the duration of erase processes may be increased by up to 50%.
- 3) Time is not dependent on program mode (5V or 3.3V).
- 4) Using 512 KByte erase commands.
- 5) Only valid when a robust EEPROM emulation algorithm is used. For more details see the Users Manual.

3.34.1 Package Parameters

Table 3-96 Thermal Characteristics of the Package

| Device | Package | RQJCT ¹⁾ | RQJCB ¹⁾ | RQJA | Unit | Note |
|--------|----------------|---------------------|---------------------|--------------------|------|---------------------------|
| TC275 | PG-LQFP-176-22 | 9,6 | 1,25 | 14,7 ²⁾ | K/W | with soldered exposed pad |
| TC277 | LF-BGA-292-6 | 5,1 | 7,2 | 15,8 ³⁾ | K/W | |

1) The top and bottom thermal resistances between the case and the ambient (R_{TCAT} , R_{TCAB}) are to be combined with the thermal resistances between the junction and the case given above (R_{TJCT} , R_{TJCB}), in order to calculate the total thermal resistance between the junction and the ambient (R_{TJA}). The thermal resistances between the case and the ambient (R_{TCAT} , R_{TCAB}) depend on the external system (PCB, case) characteristics, and are under user responsibility. The junction temperature can be calculated using the following equation: $T_J = T_A + R_{TJA} * P_D$, where the R_{TJA} is the total thermal resistance between the junction and the ambient. This total junction ambient resistance R_{TJA} can be obtained from the upper four partial thermal resistances.

Thermal resistances as measured by the 'cold plate method' (MIL SPEC-883 Method 1012.1).

2) Value is defined in accordance with JEDEC JESD51-3, JESD51-5, and JESD51-7.

3) Value is defined in accordance with JEDEC JESD51-1.

| Parameter | Symbol | Values | | | Unit | Note / Test Condition |
|--|------------|--------|------|-------|------|---|
| | | Min. | Typ. | Max. | | |
| Operation Lifetime | t_{OP} | - | - | 24500 | hour | |
| ESD susceptibility according to Human Body Model (HBM) | V_{HBM} | - | - | 2000 | V | Conforming to JESD22-A114-B |
| ESD susceptibility of the LVDS pins | V_{HBM1} | - | - | 500 | V | |
| ESD susceptibility according to Charged Device Model (CDM) | V_{CDM} | - | - | 500 | V | for all other balls/pins; conforming to JESD22-C101-C |
| | | - | - | 750 | V | for corner balls/pins; conforming to JESD22-C101-C |
| Moisture Sensitivity Level | MSL | - | - | 3 | | Conforming to Jedec J-STD--020C for 240C |

4 History

4.1 Changes from TC27xDB_v10 to 1.0

- Replace PG-LQFP-176-18 with correct package LF-BGA-292-6 in table 1
- VADC
 - Add parameter t_{WU}
 - Add parameter R_{MDU}
 - Add parameter R_{MDD}
