S32R274

S32R274 Data Sheet

Features

- On-chip modules available within the device include the following features:

- Safety core: Power Architecture® e200Z4 32-bit CPU with checker core

- Dual issue computation cores: Power Architecture® e200Z7 32-bit CPU

- 2 MB on-chip code flash (FMC flash) with ECC

- 1.5 MB on-chip SRAM with ECC

- RADAR processing
  - Signal Processing Toolbox (SPT) for RADAR signal processing acceleration
  - Cross Timing Engine (CTE) for precise timing generation and triggering
  - Waveform generation module (WGM) for chirp ramp generation
  - 4x 12-bit $\Sigma\Delta$-ADC with 10 MSps
  - One DAC with 10 MSps
  - MIPICSI2 interface to connect external ADCs

- Memory Protection
  - Each core memory protection unit provides 24 entries
  - Data and instruction bus system memory protection unit (SMPU) with 16 region descriptors each
  - Register protection

- Clock Generation
  - 40 MHz external crystal (XOSC)
  - 16 MHz Internal oscillator (IRCOSC)
  - Dual system PLL with one frequency modulated phase-locked loop (FMPLL)
  - Low-jitter PLL to $\Sigma\Delta$-ADC and DAC clock generation

- Functional Safety
  - Enables up to ASIL-D applications
  - FCCU for fault collection and fault handling
  - MEMU for memory error management
  - Safe eDMA controller
  - Self-Test Control Unit (STCU2)
  - Error Injection Module (EIM)
  - On-chip voltage monitoring
  - Clock Monitor Unit (CMU)

- Security
  - Cryptographic Security Engine (CSE2)
  - Supports censorship and life-cycle management

- Timers
  - Two Periodic Interval Timers (PIT) with 32-bit counter resolution
  - Three System Timer Module (STM)
  - Three Software Watchdog Timers (SWT)
  - Two eTimer modules with 6 channels each
  - One FlexPWM module for 12 PWM signals

- Communication Interfaces
  - Two Serial Peripheral interface (SPI) modules
  - One LINFlexD module
  - Two inter-IC communication interface (I2C) modules
  - One dual-channel FlexRay module with 128 message buffers
  - Three FlexCAN modules with configurable buffers - CAN FD optionally supported on 2 FlexCAN modules
  - One ENET MAC supporting MII/RMII/RGMII interface
  - ZipWire high-speed serial communication

- Debug Functionality
  - 4-pin JTAG interface and Nexus/Aurora interface for serial high-speed tracing
  - e200Z7 core and e200Z4 core: Nexus development interface (NDI) per IEEE-ISTO 5001-2012 Class 3+

- Two analog-to-digital converters (SAR ADC)
  - Each ADC supports up to 16 input channels
  - Cross Trigger Unit (CTU)

- On-chip voltage DC/DC regulator for core clock (VREG)

- Two Temperature Sensors (TSENS)

1.2   Feature list

On-chip modules available within the device include the following features:

- Safety core: Power Architecture® e200Z4 32-bit CPU with checker core
  - 2 cycle delayed lockstep
  - Harvard architecture with 64-bit bus for data and instructions
  - Dual issue: up to two instructions per clock cycle
  - 8 KB instruction cache and 4 KB data cache
  - 64 KB data local memory
    - with background load/store: backdoor access
    - 0-wait state for all read and 32/64-bit write accesses
    - Low number of wait states for backdoor accesses

S32R274 Data Sheet, Rev. 3.2, 07/2017

- Support for decorated storage
- Variable Length Encoding (VLE) compliant for higher code density
- Single precision floating point operations
- Computation cores: Power Architecture® e200Z7 32-bit CPU
  - Dual issue: up to two instructions per clock cycle
  - Harvard architecture with 64-bit bus for data instructions
  - 16 KB instruction cache and 16 KB data cache
  - 64 KB data local memory
    - with background load/store: backdoor access
    - 0-wait state for all read and 32/64-bit write accesses
    - Low number of wait states for backdoor accesses
  - Support for decorated storage
  - Using variable length encoding (VLE) for higher code density
  - 4-way integer processing unit (SPE2)
  - 2-way single-precision Floating Point Unit (EFPU2)
- 2 MB on-chip code flash (FMC flash) with ECC
  - Three ports (one per CPU) shared between code and data flash with 4×256 bit buffer for code and data flash including prefetch functions
  - Data flash is part of the code flash module
  - Including 64 KB EEPROM emulation

- 1.5 MB on-chip SRAM with ECC
  - Decorated memory controller to support atomic read-modify-write operations
  - Single- and double-bit error visibility is supported
  - Up to four ports (one per CPU and SPT) and up to 8 banks allow simultaneous accesses from different masters to different banks
- RADAR processing
  - Signal Processing Toolbox (SPT) for RADAR signal processing acceleration
  - Cross Timing Engine (CTE) for precise timing generation and triggering
  - Waveform generation module (WGM) for chirp ramp generation
  - 4x 12-bit $\Sigma\Delta$-ADC with 10 MSps
  - One DAC with 10 MSps
  - MIPICSI2 interface to connect external ADCs
    - Four data lanes, with up to 1 Gbps per lane and in total
    - One clock lane
- Memory Protection
  - Each core memory protection unit provides 24 entries
  - Data and instruction bus system memory protection Unit (SMPU) with 16 region descriptors each
  - Register protection
- Clock Generation
  - 40 MHz external crystal (XOSC)

- 16 MHz Internal oscillator (IRCOSC)
- Dual system PLL with one frequency modulated phase-locked loop (FMPLL)
- Low-jitter PLL to ΣΔ-ADC and DAC clock generation
- Functional Safety
  - Enables up to ASIL-D applications
  - End to end ECC ensuring full protection of all data accesses throughout the system, from each of the systems masters through the crossbar and into the memories and peripherals
  - FCCU for fault collection and fault handling
  - MEMU for memory error management
  - Safe eDMA controller
  - User selectable Memory BIST (MBIST) can be enabled to run out of various reset conditions or during runtime
  - Self-Test Control Unit (STCU2)
  - Error Injection Module (EIM)
  - On-chip voltage monitoring
  - Clock Monitor Unit (CMU) to support monitoring of critical clocks
- Security
  - Cryptographic Security Engine (CSE2) enabling advanced security management
  - Supports censorship and life-cycle management via Password and Device Security (PASS) module
  - Diary control for tamper detection (TDM)
- Support Modules
  - Global Interrupt controller (INTC) capable of routing interrupts to any CPU
  - Semaphore unit to manage access to shared resources
  - Two CRC computation units with four polynomials
  - 32-channel eDMA controller with multiple transfer request sources using DMAMUX
  - Boot Assist Module (BAM) supports internal flash programming via a serial link (LIN / CAN)
- Timers
  - Two Periodic Interval Timers (PIT) with 32-bit counter resolution
  - Three System Timer Module (STM)
  - Three Software Watchdog Timers (SWT)
  - Two eTimer modules with 6 channels each
  - One FlexPWM module for 12 PWM signals
- Communication Interfaces
  - Two Serial Peripheral interface (SPI) module
  - Two inter-IC communication interface (I2C) modules
  - One LINFlexD module
  - One dual-channel FlexRay module with 128 message buffers

S32R274 Data Sheet, Rev. 3.2, 07/2017

- Three FlexCAN modules with configurable buffers
  - CAN FD optionally supported on 2 FlexCAN modules
- One ENET MAC supporting MII/RMII/RGMII interface
  - Supports 10/100 Mbps (MII/RMII/RGMII) and >100 Mbps (RGMII)
  - Supports IEEE1588 timestamps and PTP
- Zipwire high-speed serial communication
  - Supports LFAST and SIPI protocol
  - Fast interprocessor communication with 320 Mbps gross data rate
  - DMA based access to memory resources
- Debug Functionality
  - 4-pin JTAG interface and Nexus/Aurora interface for serial high-speed tracing
  - e200Z7 core and e200Z4 core: Nexus development interface (NDI) per IEEE-ISTO 5001-2012 Class 3+
  - All platform bus masters except CSE can be monitored via Nexus/Aurora
  - Device/board boundary Scan testing supported with per Joint Test Action Group (JTAG) (IEEE 1149.1) and 1149.7 (cJTAG)
  - On-chip control for Nexus development interface by JTAGM module
- Two analog-to-digital converters (SAR ADC)
  - Each ADC supports up to 16 input channels
  - Cross Trigger Unit to enable synchronization of ADC conversions with eTimer
- On-chip voltage DC/DC regulator for core clock (VREG)
- Two Temperature Sensors (TSENS)

2　Ordering parts

2.1　Determining valid orderable parts

Valid orderable part numbers are provided on the web. To determine the orderable part numbers for this device, go to www.nxp.com and perform a part number search for the device number.

3 Part identification

3.1 Description

Part numbers for the chip have fields that identify the specific part. You can use the values of these fields to determine the specific part you have received.

3.2 Format

Part numbers for this device have the following format: S32R274

3.3 Fields

This section lists the possible values for each field in the part number (not all combinations are valid):

| F/P | — **Product Status** - P for prototype and F for qualified ordering part number |

Perf (MHz)	Z7	Z7	Z4	Z4
K	240	240	120	120
V	200	200	100	100

- F/P — **Product Status** - P for prototype and F for qualified ordering part number
- S32 — **Product Type/Brand** – 32-bit Auto MCU
- R — **Product Line** - Radar (R)
- 2 — **Generation** 2nd generation
- 7 — **Core** - z7 Power Architecture
- 4 — **Product**, number of cores
- K — **Performance**
- B — **Configuration**
- K0 — **Fab and Mask Revision** – K (TSMC14), 0 (MASK)
- M — **Temperature Suffix** - M (-40 ^{0}C to 125 ^{0}C Ta), V (-40 ^{0}C to 105 ^{0}C Ta)
- MM — **Package Suffix** - 257 MAPBGA
- R — **Tape and Reel Indicator** - R (Tape and Reel)

4 General

4.1 Introduction

The electrical specifications are preliminary and are undergoing initial evaluation. These specifications may not be fully tested or guaranteed at this early stage of the product life cycle. Finalized specifications will be published after complete characterization and device qualifications have been completed.

4.2 Absolute maximum ratings

NOTE

Functional operating conditions appear in the DC electrical characteristics. Absolute maximum ratings are stress ratings only, and functional operation at the maximum values is not guaranteed.

Stress beyond the listed maximum values may affect device reliability or cause permanent damage to the device.

1. 5.3 V for 10 hours cumulative over lifetime of device; 3.3 V +10% for time remaining.
2. Voltage overshoots during a high-to-low or low-to-high transition must not exceed 10 seconds per instance.
3. 1.45 V to 1.5 V allowed for 60 seconds cumulative time at maximum T_J = 150°C; remaining time as defined in note 5 and note 6.
4. 1.375 V to 1.45 V allowed for 10 hours cumulative time at maximum T_J = 150°C; remaining time as defined in note 6.
5. 1.32 V to 1.375 V range allowed periodically for supply with sinusoidal shape and average supply value below 1.275 V at maximum T_J=150°C.
6. TV_{DD} is relevant for all external supplies.
7. ADC inputs include an overvoltage detect function that detects any voltage higher than 1.2 V with respect to ground on either ADC input and open circuit (disconnect) the input in order to prevent damage to the ADC internal circuitry. The ADC input remains disconnected until the inputs return to the normal operating range.
8. SDADC is powered up and overvoltage protection is ON.
9. SDADC is powered up and overvoltage protection is OFF.
10. Only when $V_{DD\_HV\_IOx}$ < 3.63 V.
11. No input current injection circuitry on AFE pins.

4.3 Operating conditions

The following table describes the operating conditions for the device, and for which all specifications in the datasheet are valid, except where explicitly noted. The device operating conditions must not be exceeded, or the functionality of the device is not guaranteed.

1. Full functionality cannot be guaranteed when voltages are out of the recommended operating conditions.
2. Min voltage takes into account the LVD variation.
3. Max voltage takes into account HVD variation.
4. Aurora supply must connect to core supply voltage at board level.
5. The ground connection for the $V_{DD\_HV\_FLA}$ is shared with V_{SS}.
6. Supply range does not take into account HVD levels. Full range can be achieved after power-up, if HVD is disabled. See Voltage regulator electrical characteristics section for details.
7. Around common mode voltage of 0.7 V. Input voltage cannot exceed 1.4 V prior to AFE start-up completion (VREF and VREGs on and LVDs cleared).
8. SDADC input voltage full scale is 1.2 Vpp
9. On channels shared between ADC0 and 1, $V_{DD\_HV\_ADCREFx}$ is the lower of $V_{DD\_HV\_ADCREF0/1}$.
10. $V_{DD\_LV\_DPHY}$ supply should be shorted to core supply voltage VDD on board. Refer to AN5251. Contact your NXP sales representative for details.
11. While determining if the operating temperature specifications are met, either the ambient temperature or junction temperature specification can be used. It is critical that the junction temperature specification is not exceeded under any condition.
12. Full performance means Core0 running @ 120 MHz, Core1/2 running @ 240 MHz, SPT running @ 200 MHz, rich set of peripherals used.
13. Recommended Crystal 40 MHz (ESR≤30 Ω), 8 pF load capacitance.
14. The number is 3.5 ps when SD-ADC and/or DAC is not used in the device.

4.4 Supply current characteristics

Current consumption data is given in the following table. These specifications are design targets and are subject to change per device characterization.

Table 8. Current consumption characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
I_{DD_CORE}	Core current in run mode	All cores at max frequency. 1.31 V. Tj = 150°C	-	-	1480[1]	mA

1. All Radar AFE external bypass capacitors should be placed as close as possible to the associated package pin. As shown in Radar AFE External Components Configuration figure, most pins have two values of bypass capacitor. Greater than 0.1 µF is referred to as the larger cap. 0.1 µF is referred to as the smaller cap.

4.6   Electromagnetic Compatibility (EMC) specifications

EMC measurements to IC-level IEC standards are available from NXP on request.

4.7   Electrostatic discharge (ESD) characteristics

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts × (n + 1) supply pin). This test conforms to the AEC-Q100-002/-003/-011 standard.

NOTE
A device will be defined as a failure if after exposure to ESD pulses the device no longer meets the device specification requirements. Complete DC parametric and functional testing shall be performed per applicable device specification at room temperature followed by hot temperature, unless specified otherwise in the device specification.

Iol_h	Half drive Iol[5] (ipp_sre[1:0] = 10)	10.5	60	mA

1. Measured when pad = 0 V
2. Measured when pad = $V_{DD\_HV\_IO}$
3. Measured when pad is sourcing 2 mA
4. Measured when pad is sinking 2 mA
5. Ioh/Iol is derived from spice simulations. These values are NOT guaranteed by test.

5.1.1 RGMII pad DC electrical characteristics

Table 14. RGMII pad DC electrical specifications

Vol	Output Low Voltage[4]	—	0.2 * $V_{DD\_HV\_IO}$	V
Ioh_f	Full drive Ioh[5]	8	26	mA
Iol_f	Full drive Iol[6]	8	24	mA

1. Measured when pad = 0 V
2. Measured when pad = $V_{DD\_HV\_IO}$
3. Measured when pad is sourcing 2 mA
4. Measured when pad is sinking 2 mA
5. Ioh_f value is measured with 0.8*VDDE applied to the pad.
6. Iol_f is measured when 0.2*VDDE is applied to the pad.

5.2 I/O pad AC specifications

AC Parameters are specified over the full operating junction temperature range of -40°C to +150°C and for the full operating range of the $V_{DD\_HV\_IO}$ supply defined in Table 7.

T_{STRT_RX}	Receiver startup time[2]	—	—	5	µs
LVDS_RXOUT[3]	Receiver o/p duty cycle	30		70	%

1. Conditions for these values are $V_{DD\_LV\_IO\_AURORA}$ = 1.19V to 1.32V, T_J = –40 / 150 °C
2. Startup time is defined as the time taken by LVDS current reference block for settling bias current after its pwr_down (power down) has been deasserted. LVDS functionality is guaranteed only after the startup time.
3. Receiver o/p duty cycle is measured with 1.25 Gbps, 50% duty cycle, max 1 ns rise/fall time, 100 mV voltage swing signal applied at the receiver input.

5.4 Reset pad electrical characteristics

The device implements a dedicated bidirectional RESET_B pin.

2. Data based on characterization results, not tested in production.

6 Peripheral operating requirements and behaviours

6.1 Clocks and PLL Specifications

6.1.1 40 MHz Oscillator (XOSC) electrical characteristics

The device provides an oscillator/resonator driver.

NOTE
XTAL/EXTAL must not be directly used to drive external circuits.

Table 19. XOSC electrical characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$XOSC_{fout}$	Oscillator frequency			40		MHz
t_{stab}	Oscillator start-up time				2	ms
t_{jitcc}	Cycle to cycle jitter (peak – peak)				2.5[1]	ps
	Output Duty Cycle		45	50	55	%
Cin	Input Capacitance [2]	Extal and Xtal each	3.0	4.0	5.0	pF
R_{inLVDS}	LVDS bypass mode input termination[3]	Between Extal and Xtal	75	100	125	ohm
V_{CMLVDS}	LVDS Common Mode Voltage	Vdda/2	0.60	0.70	0.80	V

1. The number is 3.5 ps when SD-ADC and/or DAC is not used in the device.
2. When using a 40 MHz crystal, the recommended load capacitance is 8 pF. Need quiet ground connection on the board and external crystal/load capacitor placement as close to the Extal and Xtal pins as possible to allow good jitter performance.
3. The termination resistance is only active when the AFE is powered (VDD_HV_RAW, VDD_HV_DAC and the AFE regulators are powered up) and the XOSC is powered down (default case once device is out of reset) or the XOSC is configured in differential bypass mode.

6.1.2 FMPLL electrical characteristics

$f_{PLL0PHI1}$	PLL0 output clock PHI1	—	20	—	156	MHz
$t_{PLL0LOCK}$	PLL0 lock time	—	—	—	100	µs
$\Delta_{PLL0LTJ}$	PLL0 long term jitter f_{PLL0IN} = 8 MHz (resonator)[5]	$f_{PLL0PHI0}$ = 40 MHz, 1 µs			± 1	ns
		$f_{PLL0PHI0}$ = 40 MHz, 13 µs			± 1	ns
I_{PLL0}	PLL0 consumption		—	—	5	mA

1. $V_{DD\_LV\_PLL0}$ =1.25 V ± 5%, T_J = -40 / 150 °C unless otherwise specified.
2. PLL0IN clock retrieved directly from either IRCOSC or external XOSC clock.
3. f_{PLL0IN} frequency must be scaled down using PLLDIG_PLL0DV[PREDIV] to ensure the reference clock to the PLL analog loop is in the range 8 MHz-20 MHz
4. The maximum clock outputs are limited by the design clock frequency requirements as per recommended operating conditions.
5. $V_{DD\_LV\_PLL0}$ noise due to application in the range $V_{DD\_LV\_PLL0}$ = 1.25 V±5%, with frequency below PLL bandwidth (40 KHz) will be filtered.

Table 21. FMPLL1 electrical characteristics

		Down spread	0.5	—	4	%
I_{PLL1}	PLL1 consumption		—	—	6	mA

1. $V_{DD\_LV\_PLL0}$ = 1.25 V ± 5%, T_J = -40 / 150°C unless otherwise specified.
2. PLL1IN clock retrieved directly from either internal PLL0 or external XOSC clock.

δF_{var}	IRC trimmed frequency variation [1]	—	-8	—	8	%
$T_{startup}$	Startup time		—	—	5	µs

1. The typical user trim step size (δf_{TRIM}) is 0.3% of current frequency for application of positive trim and 0.26% of current frequency for application of negative trim, based on characterization results.

6.1.4   320 MHz AFE PLL electrical characteristics

Table 23.   320 MHz AFE PLL parameters

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
PLL_{fout}	Output Frequency	—	—	320	—	MHz
PLL_{fin}	Input Frequency	—	—	—	40	MHz
t_{cal}	Calibration Time [1]	LW64 = 1	—	—	150	µs
		LW64 = 0			500	
t_{lock}	Lock Time	after calibration	—	—	75	µs
t_{jitcck}	Cycle to cycle jitter (peak – peak)	—	—	—	10	ps
—	Output duty cycle	—	48	50	52	%

1. The LW64 bit sets the wait time before the PLL frequency is measured after each calibration step to allow for stabilization. If LW64 is '0', wait time of 256 reference clock cycles is used. If LW64 is'1', wait time of 64 reference clock cycles is used.

6.1.5   LFAST PLL electrical characteristics

The specifications in the following table apply to the interprocessor bus LFAST interface.

Table 24.   LFAST PLL electrical characteristics

Symbol	Parameter	Condition	Min	Typ	Max	Unit
f_{RF_REF}	PLL reference clock frequency	—	10	—	26	MHz
ERR_{REF}	PLL reference clock frequency error	—	–1	—	1	%
DC_{REF}	PLL reference clock duty cycle	—	45	—	55	%
f_{VCO}	PLL VCO frequency	—	—	640[1]	—	MHz
t_{LOCK}	PLL phase lock[2]	—	—	—	40	µs
ΔPER_{REF}	Input reference clock jitter (peak to peak)	Single period, f_{RF_REF} = 10 MHz	—	—	300	ps

		Peak	—	7	11	mA
		Power Down	—	0.5	27	µA

1. The 640 MHz frequency is achieved with a 10 MHz or 20 MHz reference clock. With a 26 MHz reference, the VCO frequency is 624 MHz.
2. The time from the PLL enable bit register write to the start of phase locks is maximum 2 clock cycles of the peripheral bridge clock that is connected to the PLL on the device.
3. Measured at the transmitter output across a 100 Ω termination resistor on a device evaluation board.

SINAD	Signal-to-noise and distortion	Fin < 50 KHz	6.02 x ENOB + 1.76			dB
ENOB	Effective number of bits	Fin < 50 KHz	10.5	—	—	bits

1. $V_{DD\_HV\_ADC}$ = 3.3 V -5%,+10%, T_J = –40 to +150°C, unless otherwise specified and analog input voltage from V_{AGND} to $V_{DD\_HV\_ADCREFx}$.
2. AD_CK clock is always half of the ADC module input clock defined via the auxiliary clock divider for the ADC.
3. During the sample time the input capacitance C_S can be charged/discharged by the external source. The internal resistance of the analog source must allow the capacitance to reach its final voltage level within t_{sample}. After the end of the sample time t_{sample}, changes of the analog input voltage have no effect on the conversion result. Values for the sample clock t_{sample} depend on programming.
4. This parameter does not include the sample time t_{sample}, but only the time for determining the digital result and the time to load the result register with the conversion result.
5. See Input equivalent circuit figure.
6. No missing codes.
7. ADC specifications are met only if injection is within these specified limits
8. Max injection current for all ADC IOs is ± 10 mA

NOTE

The ADC performance specifications are not guaranteed if two ADCs simultaneously sample the same shared channel. Aurora interface along with SAR-ADC would degrade SAR-ADC performance. General Purpose Input (GPI) functionality should not be used on any of the SAR-ADC channels when SARADC is functional.

1. Derate specification by 2 dBFS for T_j less than 0°C.
2. vdda is an internally regulated and trimmed 1.45V ± 10mV voltage.
3. The input structure of the ADC is an active RC integrator which has a frequency dependent input impedance as indicated in ADC input equivalent circuit.
4. All attenuation values are relative to 0 dB in the ADC passband.

7.3 DAC electrical specifications

NOTE
- All data is measured in single ended mode. Differential mode is guaranteed by design.
- Specifications guaranteed only if factory trims are not overridden.

Table 27.   DAC parameters

Symbol	Parameter	Condition	Min	Typ	Max	Unit
N_{BIT}	Bits	Base bits	—	12	—	Bits
		PWM bits		4 (extra lsb's)		
SPS_{DAC}	Sample rate	—	—	10	—	MSamples/s
DNL	Linearity[1]	—	-24	—	4	LSB
V_{out}	Output Voltage[1, 2, 3]	Single-Ended, Rl = 300 Ω	1.2	—	1.35	V
I_{out}	Full-Scale Output Current	DAC full-scale adjust bits set to 01 or 10	4.0	—	4.5	mA
N_{DAC}	DAC output noise [1, 4]	@250 kHz @100 kHz @10 kHz @1 kHz		—	20 30 65 170	nV/sqrt(Hz)
SOE	Static Offset Error[1, 2]	Single-Ended	60	75	100	mV
		Differential with the full-scale adjust bits set to either 01 or 10	-30	0	30	
TOE	Transient Offset Error[1, 2, 5]	After low-pass filter and averaging	—	—	0.05	LSB
t_{DV}	Transient Time Delay Variation [1, 2, 6]	LSB step	—	—	1	ns
		MSB step			10	
Oc	Output compliance	single-ended, only the DNL specification is guaranteed. The TOE and Tdv may be degraded.	0	—	1.35	V
tempco	Temperature coefficient	—	−1	—	1.0	LSB/K[2]
PSRR	Power Supply Rejection Ratio[7]	Freq < 250 KHz	30	—	—	dB

1. DAC linearity, output swing, noise, TOE, and Tdv specifications are all based upon a 300 Ω DAC output load resistor and assume that the full-scale adjust bits are set to either 01 or 10. These specifications will NOT be met for other DAC output load resistor values.
2. Once all of the LVDs have cleared and the DAC is powered on, a one-time wait time of 300 ms is required before the DAC output signal is valid.
3. The full-scale DAC output is trimmed to 1.30 V ±10 mV with all DAC inputs set to 1 including both full-scale adjust bits.
4. Rl = 300 Ω, 10uF capacitor between Vdd_HV_DAC and DAC_C, ideal supply
5. Difference between ideal and real (Va+Vb/2), for all base and PWM LSBs
6. Falling edge to falling edge or rising edge to rising edge. Any transition DACn -> DACn + 1

7. DAC PSRR is 30 dB minimum for DAC output levels of 1/3 of full-scale or less. DAC PSRR is 24 dB minimum with the DAC output at full-scale.

8   Memory modules

8.1   Flash memory program and erase specifications

NOTE
All timing, voltage, and current numbers specified in this section are defined for a single embedded flash memory within an SoC, and represent average currents for given supplies and operations.

Table 28 shows the estimated Program/Erase times.

Table 28.   Flash memory program and erase specifications

Symbol	Characteristic[1]	Typ[2]	Factory Programming[3, 4]		Field Update			Unit

t_{64kers}	64 KB Block erase time	315	490	590	420	1,600		ms
t_{64kpgm}	64 KB Block program time	138	180	210	170	1,600		ms
$t_{256kers}$	256 KB Block erase time	884	1,520	2,030	1,080	4,000	—	ms
$t_{256kpgm}$	256 KB Block program time	552	720	880	650	4,000	—	ms

1. Program times are actual hardware programming times and do not include software overhead. Block program times assume quad-page programming.
2. Typical program and erase times represent the median performance and assume nominal supply values and operation at 25 °C. Typical program and erase times may be used for throughput calculations.
3. Conditions: ≤ 150 cycles, nominal voltage.
4. Plant Programing times provide guidance for timeout limits used in the factory.
5. Typical End of Life program and erase times represent the median performance and assume nominal supply values. Typical End of Life program and erase values may be used for throughput calculations.
6. Conditions: $-40°C ≤ T_J ≤ 150°C$, full spec voltage.

8.2 Flash memory Array Integrity and Margin Read specifications

Table 29. Flash memory Array Integrity and Margin Read specifications

Symbol	Characteristic	Min	Typical	Max[1]	Units[2]
$t_{ai16kseq}$	Array Integrity time for sequential sequence on 16 KB block.	—	—	512 x Tperiod x Nread	—
$t_{ai32kseq}$	Array Integrity time for sequential sequence on 32 KB block.	—	—	1024 x Tperiod x Nread	—
$t_{ai64kseq}$	Array Integrity time for sequential sequence on 64 KB block.	—	—	2048 x Tperiod x Nread	—
$tai256kseq$	Array Integrity time for sequential sequence on 256 KB block.	—	—	8192 x Tperiod x Nread	—
$t_{mr16kseq}$	Margin Read time for sequential sequence on 16 KB block.	73.81	—	110.7	µs
$t_{mr32kseq}$	Margin Read time for sequential sequence on 32 KB block.	128.43	—	192.6	µs
$t_{mr64kseq}$	Margin Read time for sequential sequence on 64 KB block.	237.65	—	356.5	µs
$t_{mr256kseq}$	Margin Read time for sequential sequence on 256 KB block.	893.01	—	1,339.5	µs

1. Array Integrity times need to be calculated and is dependent on system frequency and number of clocks per read. The equation presented require Tperiod (which is the unit accurate period, thus for 200 MHz, Tperiod would equal 5e-9) and Nread (which is the number of clocks required for read, including pipeline contribution. Thus for a read setup that requires 6 clocks to read with no pipeline, Nread would equal 6. For a read setup that requires 6 clocks to read, and has the address pipeline set to 2, Nread would equal 4 (or 6 - 2).)
2. The units for Array Integrity are determined by the period of the system clock. If unit accurate period is used in the equation, the results of the equation are also unit accurate.

8.3 Flash memory module life specifications

Table 30. Flash memory module life specifications

Symbol	Characteristic	Conditions	Min	Typical	Units
Array P/E cycles	Number of program/erase cycles per block for 16 KB, 32 KB and 64 KB blocks.[1]	—	250,000	—	P/E cycles
	Number of program/erase cycles per block for 256 KB blocks.[2]	—	1,000	250,000	P/E cycles
Data retention	Minimum data retention.	Blocks with 0 - 1,000 P/E cycles.	50	—	Years
		Blocks with 100,000 P/E cycles.	20	—	Years
		Blocks with 250,000 P/E cycles.	10	—	Years

1. Program and erase supported across standard temperature specs.
2. Program and erase supported across standard temperature specs.

8.4 Data retention vs program/erase cycles

Graphically, Data Retention versus Program/Erase Cycles can be represented by the following figure. The spec window represents qualified limits. The extrapolated dotted line demonstrates technology capability, however is beyond the qualification limits.

9.1.2 RMII signal switching specifications

The following timing specs meet the requirements for RMII style interfaces for a range of transceiver devices.

- Measurements are with input transition of 1 ns and output load of 25 pF.

Table 34.   RMII signal switching specifications

9.1.3   RGMII signal switching specifications

The RGMII interface works at 3.3 V compatible levels as mentioned in RGMII pad DC electrical characteristics.

The following timing specs meet the requirements for RGMII style interfaces for a range of transceiver devices.
  • Measurements are with input transition of 0.750 ns and output load of 10 pF.

Table 35. RGMII signal switching specifications

Symbol	Description	Min	Typ	Max	Unit	Notes
—	Input Duty cycle (Clock from external PHY)	48	—	52	%	
Tcyc	Clock cycle duration	7.2	8.0	8.8	ns	1
TskewT	Data to clock output skew at transmitter	-500	0	500	ps	2
TskewR	Data to clock input skew at receiver	1	1.8	2.6	ns	2

Table 35. RGMII signal switching specifications (continued)

Symbol	Description	Min	Typ	Max	Unit	Notes
Duty_G	Duty cycle for Gigabit	45	50	55	%	3
Duty_T	Duty cycle for 10/100T	40	50	60	%	3
Tr/Tf	Rise/fall time (20–80%)	—	—	1.5	ns	

1. For 10 Mbps and 100 Mbps, Tcyc will scale to 400 ns ±40 ns and 40 ns ±4 ns respectively.
2. For all versions of RGMII prior to 2.0; This implies that PC board design will require clocks to be routed such that an additional trace delay of greater than 1.5 ns and less than 2.0 ns will be added to the associated clock signal. For 10/100 the Max value is unspecified.
3. Duty cycle may be stretched/shrunk during speed changes or while transitioning to a received packet's clock domain as long as minimum duty cycle is not violated and stretching occurs for no more than three Tcyc of the lowest speed transitioned between.

1. $V_{DD\_VH\_IOx}$ = 3.3 V -5%,+10%, T_J = –40 / 150 °C, unless otherwise specified
2. Startup time is defined as the time taken by LFAST current reference block for settling bias current after its pwr_down (power down) has been deasserted. LFAST functionality is guaranteed only after the startup time.
3. Startup time is defined as the time taken by LFAST transmitter for settling after its pwr_down (power down) has been deasserted. Here it is assumed that current reference is already stable. LFAST functionality is guaranteed only after the startup time.
4. Startup time is defined as the time taken by LFAST transmitter for settling after its pwr_down (power down) has been deasserted. Here it is assumed that current reference is already stable. LFAST functionality is guaranteed only after the startup time.
5. Startup time is defined as the time taken by LFAST receiver for settling after its pwr_down (power down) has been deasserted. Here it is assumed that current reference is already stable. LFAST functionality is guaranteed only after the startup time.

6. Total lumped capacitance including silicon, package pin and bond wire. Application board simulation is needed to verify LFAST template compliancy.
7. Absolute min = 0.15 V – (285 mV / 2) = 0 V
8. Absolute max = 1.6 V + (285 mV / 2) = 1.743 V

10. Total inductance including silicon, package pin and bond wire

9.4 Serial Peripheral Interface (SPI) timing specifications

The following table describes the SPI electrical characteristics.

MTEF=1 Mode timing values given below are only applicable when external SPI is in classic mode. Slave mode timing values given below are applicable when device is in MTFE=0.
- Measurements are with maximum output load of 50 pF, input transition of 1 ns and pad configured as SRE = 11.

Table 43. SPI timing

No.	Symbol	Parameter	Conditions	Min	Max	Unit
			Master (MTFE = 1, CPHA = 0)[9]	-2 + N x SPI IPG clock period [10]	—	
			Master (MTFE = 1, CPHA = 1)	−2	—	
11	t_{SUO}	Data valid (after SCK edge)	Master (MTFE = 0)	—	7 [11]	ns
			Slave	—	23	
			Master (MTFE = 1, CPHA = 0)[12]	—	7 + SPI IPG Clock Period	
			Master (MTFE = 1, CPHA = 1)	—	7	
12	t_{HO}	Data hold time for outputs	Master (MTFE = 0)	−4 [11]	—	ns
			Slave	3.8	—	
			Master (MTFE = 1, CPHA = 0) [12]	-4 + SPI IPG Clock Period	—	
			Master (MTFE = 1, CPHA = 1)	−4	—	

1. Slave Receive Only mode can operate at a maximum frequency of 60 MHz. In this mode, the SPI can receive data on SIN, but no valid data is transmitted on SOUT.
2. For SPI_CTARn[PCSSCK] - 'PCS to SCK Delay Prescaler' configuration is '3' (01h) and SPI_CTARn[CSSCK] - 'PCS to SCK Delay Scaler' configuration is '2' (0000h).
3. For SPI_CTARn[PASC] - 'After SCK Delay Prescaler' configuration is '3' (01h) and SPI_CTARn[ASC] - 'After SCK Delay Scaler' configuration is '2' (0000h).
4. The numbers are valid when SPI is configured for 50/50. Refer the Reference manual for the mapping of the duty cycle to each configuration. A change in duty cycle changes the parameter here. For example, a configuration providing duty cycle of 33/66 at SPI translates to min tSCK/3 - 1.5 ns and max tSCK/3 + 1.5 ns.
5. The slave mode parameters (t_{SUI}, t_{HI}, t_{SUO} and t_{HO}) assume 50% duty cycle on SCK input. Any change in SCK duty cycle input must be taken care during the board design or by the master timing.
6. The slave receive only mode parameters (t_{SUI} and t_{HI}) assume 50% duty cycle on SCK input. Any change in SCK duty cycle input must be taken care during the board design or by the master timing. However, there is additional restriction in the slave receive only mode that the duty cycle at the slave input should not go below t_{sdc}(min) corresponding to the t_{sdc}(min) for the slave receive mode.
7. In the master mode, this is governed by t_{PCSSCK}. Refer the SPI chapter in the Reference Manual for details. The minimum spec is valid only for SPI_CTARn[PCSSCK]= '0b01' (PCS to SCK delay prescalar of 3) or higher.
8. In the master mode, this is governed by t_{PASC}. Refer the SPI chapter in the Reference Manual for details. The minimum spec is valid only for SPI_CTARn[PASC]= '0b01' (after SCK delay prescalar of 3) or higher.
9. For SPI_CTARn[BR] - 'Baud Rate Scaler' configuration is >= 4.
10. N = Configured sampling point value in MTFE=1 Mode.
11. Same value is applicable for PCS timing in continuous SCK mode.
12. SPI_MCR[SMPL_PT] should be set to 1.

1. Programming IBFD (I^{2}C Bus Frequency Divider Register) with the maximum frequency results in the minimum output timings listed. The I^{2}C interface is designed to scale the data transition time, moving it to the middle of the SCL low period. The actual position is affected by the prescale and division values programmed in IBDR (I^{2}C Bus Data I/O Register).
2. Serial data (SDA) and Serial clock (SCL) reaches peak level depending upon the external signal capacitance and pull up resistor values as SDA and SCL are open-drain type outputs which are only actively driven low by the I^{2}C module.

15 Thermal Specifications

15.1 Thermal characteristics

Table 55. 257MAPBGA package thermal characteristics

Symbol	Parameter	Conditions	257MAPBGA	Unit
$R_{\theta JA}$	Thermal resistance, junction-to-ambient natural convection [1, 2]	Single layer board - 1s	41.8	°C/W
		Four layer board - 2s2p[3]	22.3	
$R_{\theta JMA}$	Thermal resistance, junction-to-ambient forced convection at 200 ft/min[1, 3]	Single layer board - 1s	29.8	°C/W
		Four layer board - 2s2p	17.7	
$R_{\theta JB}$	Thermal resistance junction-to-board[4]	—	7.6	°C/W
$R_{\theta JC}$	Thermal resistance junction-to-case[5]	—	5.2	°C/W
Ψ_{JT}	Junction-to-package-top natural convection[6]	—	0.2	°C/W

1. Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.
2. Per SEMI G38-87 and JEDEC JESD51-2 with the single layer board horizontal.
3. Per JEDEC JESD51-6 with the board horizontal.
4. Junction-to-Board thermal resistance determined per JEDEC JESD51-8. Thermal test board meets JEDEC specification for the specified package. Board temperature is measured on the top surface of the board near the package.
5. Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).
6. Thermal characterization parameter indicating the temperature difference between the package top and the junction temperature per JEDEC JESD51-2.

15.1.1 General notes for specifications at maximum junction temperature

An estimation of the chip junction temperature, T_J, can be obtained from this equation:

$$T_J = T_A + (R_{\theta JA} \times P_D)$$

$$T_J = T_{BRD} + (R_{\theta JB} \times P_D)$$

where:
- T_A = ambient temperature for the package (°C)
- $R_{\theta JA}$ = junction to ambient thermal resistance (°C/W)
- $R_{\theta JB}$ = junction to board thermal resistance (°C/W)
- $T_{\theta BRD}$ = average board temperature just outside the package periphery (°C)
- P_D = power dissipation in the package (W)

The junction to ambient thermal resistance is an industry standard parameter that provides a quick and easy estimation of thermal performance. However, junction to board thermal resistance is more appropriate for tight enclosure spaces where board temperature should be used as reference temperature. Using 2s2p board with natural convection conditions, junction temperature is found to be less than 150°C . There are two parameters in common usage: the value determined on a single layer board and the value obtained on a board with two inner planes. For packages such as PBGA, these values can significantly differ. For customer board design with different number of layers and copper percentage content, these values must be appropriately interpolated in order to evaluate junction temperature. In general, the value obtained on a single layer board is appropriate for the tightly packed printed circuit board. The value obtained on the board with the internal planes is usually appropriate if the board has low power dissipation and the components are well separated.

When a heat sink is used, the thermal resistance is expressed in the following equation as the sum of a junction-to-case thermal resistance and a case-to-ambient thermal resistance:

$$R_{\theta JA} = R_{\theta JC} + R_{\theta CA}$$

where:
- $R_{\theta JA}$ = junction to ambient thermal resistance (°C/W)
- $R_{\theta JC}$ = junction to case thermal resistance (°C/W)
- $R_{\theta CA}$ = case to ambient thermal resistance (°C/W)

$R_{\theta JC}$ is device related and cannot be influenced by the user. The user controls the thermal environment to change the case to ambient thermal resistance, $R_{\theta CA}$. For instance, the user can change the size of the heat sink, the air flow around the device, the interface material, the mounting arrangement on printed circuit board, or change the thermal dissipation on the printed circuit board surrounding the device.

To determine the junction temperature of the device in the application when heat sinks are not used, the Thermal Characterization Parameter (Ψ_{JT}) can be used to determine the junction temperature with a measurement of the temperature at the top center of the package case using this equation:

$$T_J = T_T + (\Psi_{JT} \times P_D)$$

where:
- T_T = thermocouple temperature on top of the package (°C)
- Ψ_{JT} = thermal characterization parameter (°C/W)
- P_D = power dissipation in the package (W)

The thermal characterization parameter is measured per JESD51-2 specification using a 40 gauge type T thermocouple epoxied to the top center of the package case. The thermocouple should be positioned so that the thermocouple junction rests on the

package. A small amount of epoxy is placed over the thermocouple junction and over about 1 mm of wire extending from the junction. The thermocouple wire is placed flat against the package case to avoid measurement errors caused by cooling effects of the thermocouple wire.

17   Reset sequence

This section describes different reset sequences and details the duration for which the device remains in reset condition in each of those conditions.

17.1 Reset sequence duration

Table 57 specifies the minimum and the maximum reset sequence duration for the five different reset sequences described in Reset sequence description.

Table 57. RESET sequences

No.	Symbol	Parameter	T_{Reset}			Unit
			Min	Typ	Max[1]	
1	T_{DRB}	Destructive Reset Sequence, BIST enabled	15		50[2]	ms
2	T_{DR}	Destructive Reset Sequence, BIST disabled	400		2000	µs
3	T_{ERLB}	External Reset Sequence Long, BIST enabled	15		50	ms
4	T_{FRL}	Functional Reset Sequence Long, BIST disabled	400		2000	µs
5	T_{FRS}	Functional Reset Sequence Short[3]	1		500	µs

1. The maximum value is applicable only if the reset sequence duration is not prolonged by an extended assertion of $\overline{RESET}$ by an external reset generator.
2. Max time is based on STCU BIST configuration execution time + max RESET time (TDR). For default STCU BIST configuration execution time, refer to EB834. Contact your NXP sales representative for details.
3. BIST is not executed on short functional reset

17.2 Reset sequence description

The figures in this section show the internal states of the device during the five different reset sequences. The doted lines in the figures indicate the starting point and the end point for which the duration is specified in Table 57.

With the beginning of DRUN mode, the first instruction is fetched and executed. At this point, application execution starts and the internal reset sequence is finished.

The SMPS self test is always triggered during Phase3 after a destructive reset so that duration is included into Phase3 below.

In external regulation mode, the VREG_POR_B pin should be de-asserted only when all the design supplies are in operating range. Deassertion of VREG_POR_B pin triggers the start of reset sequence in internal as well as external regulation modes.

The following figures show the internal states of the device during the execution of the reset sequence and the possible states of the RESET_B signal pin.

NOTE

RESET_B is a bidirectional pin. The voltage level on this pin can either be driven low by an external reset generator or by the device internal reset circuitry. A high level on this pin can only

be generated by an external pullup resistor which is strong enough to overdrive the weak internal pulldown resistor. The rising edge on RESET_B in the following figures indicates the time when the device stops driving it low. The reset sequence durations given in Table 57 are applicable only if the internal reset sequence is not prolonged by an external reset generator keeping RESET_B asserted low beyond the last Phase3.
Figure 43. Destructive reset sequence, BIST enabled
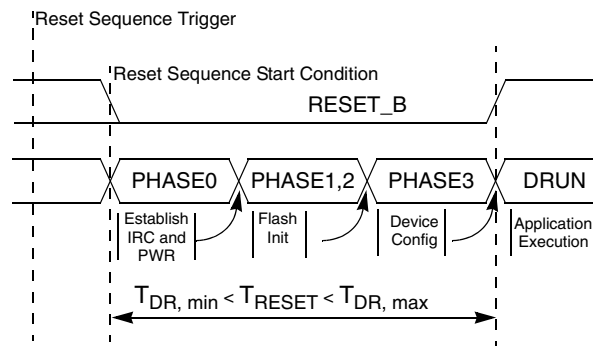

Figure 44. Destructive reset sequence, BIST disabled
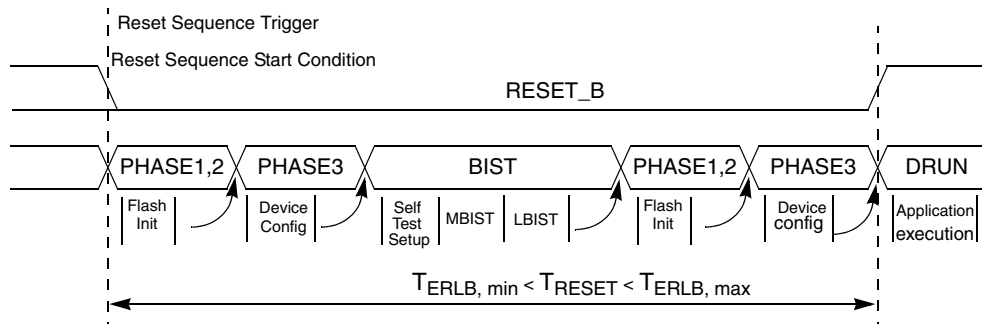

Figure 45. External reset sequence long, BIST enabled
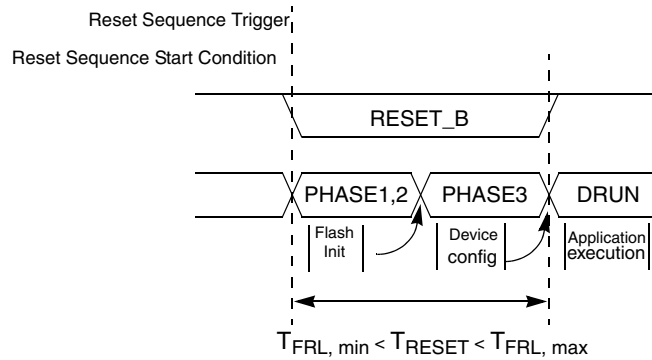

Figure 46. Functional reset sequence long
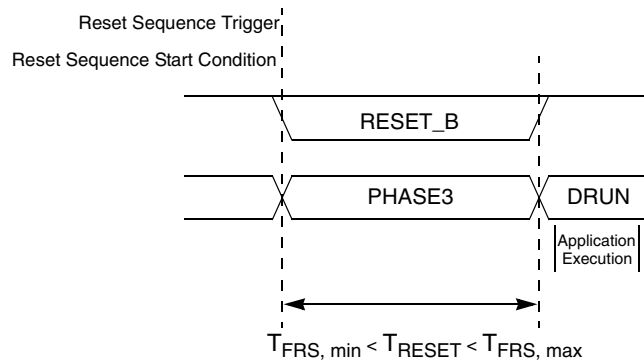

Figure 47. Functional reset sequence short

The reset sequences shown in Figure 46 and Figure 47 are triggered by functional reset events. $\overline{\text{RESET}}$ is driven low during these two reset sequences only if the corresponding functional reset source (which triggered the reset sequence) was enabled to drive RESET_B low for the duration of the internal reset sequence. See the RGM_FBRE register in the device reference manual for more information.

18 Power sequencing requirements

The device does not require any specific power sequencing as far as user follows recommendations in this section.

Either ramp $V_{DD\_HV\_IO}$ and $V_{DD\_HV\_PMU}$ together or ramp $V_{DD\_HV\_IO}$ before $V_{DD\_HV\_PMU}$ such that the two supplies always maintain 100 mV or less difference, when using internal regulation mode. $V_{DD\_LV\_DPHY}$ and $V_{DD\_LV\_CORE}$ are to be driven from same source. $V_{DD\_HV\_IO}$, $V_{DD\_HV\_IO\_RGMII}$, $V_{DD\_HV\_IO\_PWM}$ and $V_{DD\_HV\_IO\_LFAST}$ supplies should be treated as a single supply from board perspective.

As mentioned in the previous section, it is expected that the external ASIC which powers up the device in external regulation mode deasserts VREG_POR_B pin only when all the power supplies to the design are in operating range.

It should be noted that LVD and HVD detectors on VDD supply are disabled by default in external regulation mode for preventing a conflict with external regulator operation but they can be enabled by software once design is powered up.

While designing the system, it is important to ensure that AFE supplies are powered up before data is sent on its input pads.

2	25 Nov 2016	• Editorial changes.
		• Replaced the term 'Freescale' with 'NXP' throughout the document.
		• In Family comparison table,
		  • 'MPC5775K' column, added FD support for MCAN
		• In Fields section, added detailed information about supported chip parts.
		• In Commercial product code structure figure, Tape and Reel indicator field, removed the 'T' (Tray/Tubes) category.
		• In Absolute maximum ratings table,
		  • removed footnote 1 "Absolute maximum voltages ....been determined."
		  • revised footnote for T_{VDD}.
		• In Operating conditions table,
		  • 'T_A' parameter maximum value updated from 105ºC to 125ºC, updated foonote
		    • From: When determining if the operating temperature specifications are met, either the ambient temperature or junction temperature specification can be used. It is not necessary that both specifications be met at all times. However, it is critical that the junction temperature specification is not exceeded under any condition.
		    • To: While determining if the operating temperature specifications are met, either the ambient temperature or junction temperature specification can be used. It is critical that the junction temperature specification is not exceeded under any condition.
		  • 'T_A' parameter, updated footnote
		    • From: Full performance means Core0 running @ 133.33 MHz, Core1/2 running @ 266.66 MHz, SPT running @ 200 MHz, rich set of peripherals used.
		    • To: Full performance means Core0 running @ 120 MHz, Core1/2 running @ 240 MHz, SPT running @ 200 MHz, rich set of peripherals used.
		• updated $V_{DD\_LV\_DPHY}$ typical value to 1.25 V and added a footnote to refer to 'AN5251'.
		• revised $LVDSV_{inxoscclk(p-p)}$ values.
