

# ADS54J64 Quad-Channel, 14-Bit, 1-GSPS, 2x Oversampling, Analog-to-Digital Converter

## 1 Features

- Quad Channel, 14-Bit Resolution
- Maximum Sampling Rate: 1 GSPS
- Maximum Output Sample Rate: 500 MSPS
- High-Impedance Analog Input Buffer
- Analog Input Bandwidth (–3 dB): 1 GHz
- Output Options:
  - Digital Down Conversion (DDC) Using 16-Bit NCO
  - DDC Bypass With Full Rate Output Up to 500 MSPS
- Differential Full-Scale Input: 1.1 V<sub>PP</sub>
- JESD204B Interface:
  - Subclass 1 Support
  - 1 Lane per ADC Up to 10 Gbps
  - Dedicated SYNC Pin for Pair of Channels
- Support for Multi-Chip Synchronization
- Spectral Performance:
  - $f_{IN} = 190\text{-MHz IF at } -1\text{ dBFS}$ :
    - SNR: 69 dBFS
    - NSD: –153 dBFS/Hz
    - SFDR: 86 dBc (HD2, HD3), 95 dBFS (Non HD2, HD3)
  - $f_{IN} = 370\text{-MHz IF at } -3\text{ dBFS}$ :
    - SNR: 68.5 dBFS
    - NSD: –152.5 dBFS/Hz
    - SFDR: 80 dBc (HD2, HD3), 86 dBFS (Non HD2, HD3)
- 72-Pin VQFN Package (10 mm × 10 mm)
- Power Consumption: 625 mW/Ch, 2.5 W Total
- Power Supplies: 1.15 V, 1.15 V, 1.9 V

## 2 Applications

- Multi-Carrier Multi-Mode, GSM Cellular Infrastructure Base Stations
- Telecommunications Receivers
- Radar and Antenna Arrays
- Cable CMTS, DOCSIS 3.1 Receivers
- Communications Test Equipment
- Microwave Receivers
- Software Defined Radio (SDR)
- Digitizers
- Medical Imaging and Diagnostics

## 3 Description

The ADS54J64 device is a quad-channel, 14-bit, 1-GSPS, analog-to-digital converter (ADC) offering wide-bandwidth, 2x oversampling and high SNR. The ADS54J64 supports a JESD204B serial interface with data rates up to 10 Gbps with one lane per channel. The buffered analog input provides uniform impedance across a wide frequency range and minimizes sample-and-hold glitch energy. The ADS54J64 provides excellent spurious-free dynamic range (SFDR) over a large input frequency range with very low power consumption. The digital signal processing block includes complex mixers followed by low-pass filters with decimate-by-2 and -4 options supporting up to a 200-MHz receive bandwidth. The ADS54J64 also supports a 14-bit, 500-MSPS output in DDC bypass mode.

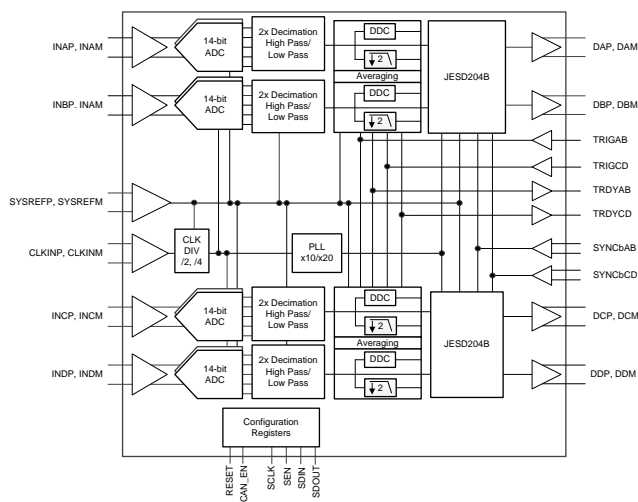

A four-lane JESD204B interface simplifies connectivity, allowing high system integration density. An internal phase-locked loop (PLL) multiplies the incoming ADC sampling clock to derive the bit clock that is used to serialize the 14-bit data from each channel.

### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
ADS54J64	VQFN (72)	10.00 mm × 10.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

## 5 Pin Configuration and Functions

**RMP Package  
72-Pin VQFN  
Top View**

**Pin Functions**

PIN		I/O	DESCRIPTION
NAME	NO.		
<b>INPUT, REFERENCE</b>			
INAM	41	I	Differential analog input pin for channel A, internal bias via a 2-kΩ resistor to $V_{CM}$
INAP	42		
INBM	37	I	Differential analog input pin for channel B, internal bias via a 2-kΩ resistor to $V_{CM}$
INBP	36		
INCM	18	I	Differential analog input pin for channel C, internal bias via a 2-kΩ resistor to $V_{CM}$
INCP	19		
INDM	14	I	Differential analog input pin for channel D, internal bias via a 2-kΩ resistor to $V_{CM}$
INDP	13		
<b>CLOCK, SYNC</b>			
CLKINM	28	I	Differential clock input pin for the ADC with internal 100-Ω differential termination; requires external ac coupling
CLKINP	27		
SYSREFM	34	I	External SYSREF input; requires dc coupling and external termination
SYSREFP	33		

**Pin Functions (continued)**

PIN		I/O	DESCRIPTION
NAME	NO.		
<b>CONTROL, SERIAL</b>			
NC	1, 2, 22, 23, 53, 54	—	No connection
PDN	50	I/O	Power down. This pin can be configured via an SPI register setting. This pin has an internal 10-k $\Omega$ pulldown resistor.
RES	49	—	Reserved pin, connect to GND
RESET	48	I	Hardware reset; active high. This pin has an internal 10-k $\Omega$ pulldown resistor.
SCLK	6	I	Serial interface clock input. This pin has an internal 10-k $\Omega$ pulldown resistor.
SDIN	5	I	Serial interface data input. This pin has an internal 10-k $\Omega$ pulldown resistor.
SDOUT	11	O	1.8-V logic serial interface data output
SEN	7	I	Serial interface enable. This pin has an internal 10-k $\Omega$ pullup resistor to DVDD.
<b>DATA INTERFACE</b>			
DAM	59	O	JESD204B serial data output pin for channel A
DAP	58		
DBM	62	O	JESD204B serial data output pin for channel B
DBP	61		
DCM	65	O	JESD204B serial data output pin for channel C
DCP	66		
DDM	68	O	JESD204B serial data output pin for channel D
DDP	69		
SYNCbABM	56	I	Synchronization input pin for JESD204B port channels A and B. This pin can be configured via SPI to a SYNCb signal for all four channels. This pin has an internal differential termination of 100 $\Omega$ .
SYNCbABP	55		
SYNCbCDM	71	I	Synchronization input pin for JESD204B port channels C and D. This pin can be configured via SPI to a SYNCb signal for all four channels. This pin has an internal differential termination of 100 $\Omega$ .
SYNCbCDP	72		
<b>POWER SUPPLY</b>			
AGND	21, 26, 29, 32	I	Analog ground
AVDD	9, 12, 15, 17, 20, 25, 30, 35, 38, 40, 43, 44, 46	I	Analog 1.15-V power supply
AVDD19	10, 16, 24, 31, 39, 45	I	Analog 1.9-V supply for analog buffer
DGND	3, 52, 60, 63, 67	I	Digital ground
DVDD	4, 8, 47, 51, 57, 64, 70	I	Digital 1.15-V power supply
Thermal pad	Pad	—	Connect to GND

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Supply voltage	AVDD19	-0.3	2.1	V
	AVDD	-0.3	1.4	
	DVDD	-0.3	1.4	
Voltage between AGND and DGND		-0.3	0.3	V
Voltage applied to input pins	INAP, INBP, INAM, INBM, INCP, INDP, INCM, INDM	-0.3	2.1	V
	CLKINP, CLKINM	-0.3	AVDD + 0.3	
	SYSREFP, SYSREFM	-0.3	1.9	
	SCLK, SEN, SDIN, RESET, SYNCbABP, SYNCbABM, SYNCbCDP, SYNCbCDM, PDN, TRIGAB, TRIGCD	-0.2	AVDD19 + 0.3	
Storage temperature, T <sub>stg</sub>		-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 6.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
Supply voltage range	AVDD19	1.8	1.9	2	V
	AVDD	1.1	1.15	1.2	
	DVDD	1.1	1.15	1.2	
Analog inputs	Differential input voltage range	1.1			V <sub>PP</sub>
	Input common-mode voltage (VCM)	1.3			V
Clock inputs	Input clock frequency, device clock frequency		400	1000	MHz
	Input clock amplitude differential (V <sub>CLKP</sub> - V <sub>CLKM</sub> )	Sine wave, ac-coupled		1.5	V <sub>PP</sub>
		LVPECL, ac-coupled		1.6	
		LVDS, ac-coupled		0.7	
Input device clock duty cycle, default after reset		45%	50%	55%	
Temperature	Operating free-air, T <sub>A</sub>		-40	100 <sup>(1)</sup>	°C
	Operating junction, T <sub>J</sub>		105 <sup>(2)</sup>		
	Specified maximum, measured at the device footprint thermal pad on the printed circuit board, T <sub>P-MAX</sub>		104.5 <sup>(3)</sup>		

- (1) Assumes system thermal design meets the T<sub>J</sub> specification.  
(2) Prolonged use above this junction temperature can increase the device failure-in-time (FIT) rate.  
(3) The recommended maximum temperature at the PCB footprint thermal pad assumes the junction-to-package bottom thermal resistance, R<sub>θJC(bot)</sub> = 0.2°C/W, the thermal resistance of the device thermal pad connection to the PCB footprint is negligible, and the device power consumption is 2.5 W.

## 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		ADS54J64	UNIT
		RMP (VQFN <sup>P</sup> )	
		72 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance <sup>(2)</sup>	22.3	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance <sup>(3)</sup>	5.1	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance <sup>(3)</sup>	2.4	°C/W
$\Psi_{JT}$	Junction-to-top characterization parameter <sup>(4)</sup>	0.1	°C/W
$\Psi_{JB}$	Junction-to-board characterization parameter <sup>(5)</sup>	2.3	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance <sup>(6)</sup>	0.2	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.
- (2) The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, high-K board, as specified in JESD51-7, in an environment described in JESD51-2a.
- (3) The junction-to-case (top) thermal resistance is obtained by simulating a cold plate test on the package top. No specific JEDEC-standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.
- (4) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.
- (5) The junction-to-top characterization parameter,  $\Psi_{JT}$ , estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining  $\theta_{JA}$ , using a procedure described in JESD51-2a (sections 6 and 7).
- (6) The junction-to-board characterization parameter,  $\Psi_{JB}$ , estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining  $\theta_{JA}$ , using a procedure described in JESD51-2a (sections 6 and 7).

## 6.5 Electrical Characteristics

typical values are at  $T_A = 25^\circ\text{C}$ , full temperature range is from  $T_{\text{MIN}} = -40^\circ\text{C}$  to  $T_{\text{MAX}} = +100^\circ\text{C}$ , input clock frequency = 1 GHz, 50% clock duty cycle, output sample rate = 500 MSPS,  $\text{AVDD19} = 1.9\text{ V}$ ,  $\text{AVDD} = \text{DVDD} = 1.15\text{ V}$ ,  $-1\text{-dBFS}$  differential input, and  $f_{\text{IN}} = 190\text{ MHz}$  (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>GENERAL</b>						
ADC sampling rate					1	GPS
Resolution			14			Bits
<b>POWER SUPPLY</b>						
AVDD19	1.9-V analog supply		1.85	1.9	1.95	V
AVDD	1.15-V analog supply		1.1	1.15	1.2	V
DVDD	1.15-V digital supply		1.1	1.15	1.2	V
$I_{\text{AVDD19}}$	1.9-V analog supply current	100-MHz, full-scale input on all four channels		618		mA
$I_{\text{AVDD}}$	1.15-V analog supply current	100-MHz, full-scale input on all four channels		415		mA
$I_{\text{DVDD}}$	1.15-V digital supply current	DDC bypass mode (mode 8), 100-MHz, full-scale input on all four channels		629		mA
		Mode 3, 100-MHz, full-scale input on all four channels		730		
		Mode 0 and 2, 100-MHz, full-scale input on all four channels		674		
		Mode 1, 4, 6, and 7, 100-MHz, full-scale input on all four channels		703		
$P_{\text{DIS}}$	Total power dissipation	DDC bypass mode (mode 8), 100-MHz, full-scale input on all four channels		2.37		W
		Mode 3, 100-MHz, full-scale input on all four channels		2.49		
		Mode 0 and 2, 100-MHz, full-scale input on all four channels		2.42		
		Mode 1, 4, 6, and 7, 100-MHz, full-scale input on all four channels		2.46		
Global power-down power dissipation		Full-scale input on all four channels		120		mW
<b>ANALOG INPUTS</b>						
Differential input full-scale voltage				1.1		$V_{\text{PP}}$
Input common-mode voltage				1.3		V
Differential input resistance		At $f_{\text{IN}} = \text{dc}$		4		$\text{k}\Omega$
Differential input capacitance				2.5		pF
Analog input bandwidth (3 dB)				1000		MHz
<b>ISOLATION</b>						
Crosstalk <sup>(1)</sup> isolation between near channels (channels A and B are near to each other, channels C and D are near to each other)	$f_{\text{IN}} = 10\text{ MHz}$			75		dBFS
	$f_{\text{IN}} = 100\text{ MHz}$			75		
	$f_{\text{IN}} = 170\text{ MHz}$			74		
	$f_{\text{IN}} = 270\text{ MHz}$			72		
	$f_{\text{IN}} = 370\text{ MHz}$			71		
	$f_{\text{IN}} = 470\text{ MHz}$			70		
Crosstalk <sup>(1)</sup> isolation between far channels (channels A and B are far from channels C and D)	$f_{\text{IN}} = 10\text{ MHz}$			110		dBFS
	$f_{\text{IN}} = 100\text{ MHz}$			110		
	$f_{\text{IN}} = 170\text{ MHz}$			110		
	$f_{\text{IN}} = 270\text{ MHz}$			110		
	$f_{\text{IN}} = 370\text{ MHz}$			110		
	$f_{\text{IN}} = 470\text{ MHz}$			110		

(1) Crosstalk is measured with a  $-1\text{-dBFS}$  input signal on the aggressor channel and no input on the victim channel.

## Electrical Characteristics (continued)

typical values are at  $T_A = 25^\circ\text{C}$ , full temperature range is from  $T_{\text{MIN}} = -40^\circ\text{C}$  to  $T_{\text{MAX}} = +100^\circ\text{C}$ , input clock frequency = 1 GHz, 50% clock duty cycle, output sample rate = 500 MSPS, AVDD19 = 1.9 V, AVDD = DVDD = 1.15 V, -1-dBFS differential input, and  $f_{\text{IN}} = 190\text{ MHz}$  (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>CLOCK INPUT</b>					
Internal clock biasing	CLKINP and CLKINM pins are connected to the internal biasing voltage through a 5-k $\Omega$ resistor		0.7		V

## 6.6 AC Performance

typical values are at  $T_A = 25^\circ\text{C}$ , full temperature range is from  $T_{\text{MIN}} = -40^\circ\text{C}$  to  $T_{\text{MAX}} = +100^\circ\text{C}$ , input clock frequency = 1 GHz, 50% clock duty cycle, output sample rate = 500 MSPS, AVDD19 = 1.9 V, AVDD = DVDD = 1.15 V, -1-dBFS differential input, and  $f_{\text{IN}} = 190\text{ MHz}$  (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	MIN	TYP	MAX	UNIT	
		DDC BYPASS MODE			DECIMATE-BY-4 (DDC Mode 2)				
SNR	Signal-to-noise ratio	$f_{\text{IN}} = 10\text{ MHz}, A_{\text{IN}} = -1\text{ dBFS}$		69.9	72.2			dBFS	
		$f_{\text{IN}} = 70\text{ MHz}, A_{\text{IN}} = -1\text{ dBFS}$		69.6	71.8				
		$f_{\text{IN}} = 190\text{ MHz}, A_{\text{IN}} = -1\text{ dBFS}$		69.2	71.8				
		$f_{\text{IN}} = 190\text{ MHz}, A_{\text{IN}} = -3\text{ dBFS}$		66.5	69.6	71			
		$f_{\text{IN}} = 300\text{ MHz}, A_{\text{IN}} = -3\text{ dBFS}$		69.3	71.7				
		$f_{\text{IN}} = 370\text{ MHz}, A_{\text{IN}} = -3\text{ dBFS}$		68.7	71.3				
		$f_{\text{IN}} = 470\text{ MHz}, A_{\text{IN}} = -3\text{ dBFS}$		68.4	69.8				
NSD	Noise spectral density	$f_{\text{IN}} = 10\text{ MHz}, A_{\text{IN}} = -1\text{ dBFS}$		-153.9	-153.2			dBFS/Hz	
		$f_{\text{IN}} = 70\text{ MHz}, A_{\text{IN}} = -1\text{ dBFS}$		-153.6	-152.8				
		$f_{\text{IN}} = 190\text{ MHz}, A_{\text{IN}} = -1\text{ dBFS}$		-153.2	-152.7				
		$f_{\text{IN}} = 190\text{ MHz}, A_{\text{IN}} = -3\text{ dBFS}$		-150.5	-153.6	-153.2			
		$f_{\text{IN}} = 300\text{ MHz}, A_{\text{IN}} = -3\text{ dBFS}$		-152.8	-152.7				
		$f_{\text{IN}} = 370\text{ MHz}, A_{\text{IN}} = -3\text{ dBFS}$		-152.5	-152.2				
		$f_{\text{IN}} = 470\text{ MHz}, A_{\text{IN}} = -3\text{ dBFS}$		-151.5	-151				
SFDR <sup>(1)</sup>	Spurious-free dynamic range	$f_{\text{IN}} = 10\text{ MHz}, A_{\text{IN}} = -1\text{ dBFS}$		83	83			dBc	
		$f_{\text{IN}} = 70\text{ MHz}, A_{\text{IN}} = -1\text{ dBFS}$		81	100				
		$f_{\text{IN}} = 190\text{ MHz}, A_{\text{IN}} = -1\text{ dBFS}$		87	100				
		$f_{\text{IN}} = 190\text{ MHz}, A_{\text{IN}} = -3\text{ dBFS}$		78	88	98			
		$f_{\text{IN}} = 300\text{ MHz}, A_{\text{IN}} = -3\text{ dBFS}$		79	98				
		$f_{\text{IN}} = 370\text{ MHz}, A_{\text{IN}} = -3\text{ dBFS}$ , input clock frequency = 983.04 MHz		82	70				
		$f_{\text{IN}} = 470\text{ MHz}, A_{\text{IN}} = -3\text{ dBFS}$		78	76				
SINAD	Signal-to-noise and distortion ratio	$f_{\text{IN}} = 10\text{ MHz}, A_{\text{IN}} = -1\text{ dBFS}$		68.5	70.6			dBFS	
		$f_{\text{IN}} = 70\text{ MHz}, A_{\text{IN}} = -1\text{ dBFS}$		68.5	70.6				
		$f_{\text{IN}} = 190\text{ MHz}, A_{\text{IN}} = -1\text{ dBFS}$		68.2	72.2				
		$f_{\text{IN}} = 190\text{ MHz}, A_{\text{IN}} = -3\text{ dBFS}$		68.5	73				
		$f_{\text{IN}} = 300\text{ MHz}, A_{\text{IN}} = -3\text{ dBFS}$		68.9	72.3				
		$f_{\text{IN}} = 370\text{ MHz}, A_{\text{IN}} = -3\text{ dBFS}$		68	68.2				
		$f_{\text{IN}} = 470\text{ MHz}, A_{\text{IN}} = -3\text{ dBFS}$		68	69				

(1) Harmonic distortion performance can be significantly improved by using the frequency planning explained in the [Frequency Planning](#) section.

## AC Performance (continued)

typical values are at  $T_A = 25^\circ\text{C}$ , full temperature range is from  $T_{\text{MIN}} = -40^\circ\text{C}$  to  $T_{\text{MAX}} = +100^\circ\text{C}$ , input clock frequency = 1 GHz, 50% clock duty cycle, output sample rate = 500 MSPS, AVDD19 = 1.9 V, AVDD = DVDD = 1.15 V, -1-dBFS differential input, and  $f_{\text{IN}} = 190\text{ MHz}$  (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	MIN	TYP	MAX	UNIT
		DDC BYPASS MODE			DECIMATE-BY-4 (DDC Mode 2)			
HD2 <sup>(1)</sup>	Second-order harmonic distortion	$f_{\text{IN}} = 10\text{ MHz}, A_{\text{IN}} = -1\text{ dBFS}$		-83		-90		dBc
		$f_{\text{IN}} = 70\text{ MHz}, A_{\text{IN}} = -1\text{ dBFS}$		-82		-100		
		$f_{\text{IN}} = 190\text{ MHz}, A_{\text{IN}} = -1\text{ dBFS}$		-85		-98		
		$f_{\text{IN}} = 190\text{ MHz}, A_{\text{IN}} = -3\text{ dBFS}$	-78	-86		-100		
		$f_{\text{IN}} = 300\text{ MHz}, A_{\text{IN}} = -3\text{ dBFS}$		-82		-100		
		$f_{\text{IN}} = 370\text{ MHz}, A_{\text{IN}} = -3\text{ dBFS}$ input clock frequency = 983.04 MHz		-82		-69		
		$f_{\text{IN}} = 470\text{ MHz}, A_{\text{IN}} = -3\text{ dBFS}$		-100		-94		
HD3 <sup>(1)</sup>	Third-order harmonic distortion	$f_{\text{IN}} = 10\text{ MHz}, A_{\text{IN}} = -1\text{ dBFS}$		-83		-85		dBc
		$f_{\text{IN}} = 70\text{ MHz}, A_{\text{IN}} = -1\text{ dBFS}$		-81		-100		
		$f_{\text{IN}} = 190\text{ MHz}, A_{\text{IN}} = -1\text{ dBFS}$		-92		-100		
		$f_{\text{IN}} = 190\text{ MHz}, A_{\text{IN}} = -3\text{ dBFS}$	-78	-92		-100		
		$f_{\text{IN}} = 300\text{ MHz}, A_{\text{IN}} = -3\text{ dBFS}$		-90		-100		
		$f_{\text{IN}} = 370\text{ MHz}, A_{\text{IN}} = -3\text{ dBFS}$		-90		-100		
		$f_{\text{IN}} = 470\text{ MHz}, A_{\text{IN}} = -3\text{ dBFS}$		-80		-79

## 7 Detailed Description

### 7.1 Overview

The ADS54J64 is a quad-channel device with a complex digital down-converter (DDC) and digital decimation to allow flexible signal processing to suit different usage cases. Each channel is composed of two interleaved analog-to-digital converters (ADCs) sampling at half the input clock rate. The 2x interleaved data are decimated by 2 to provide a processing gain of 3 dB. The decimation filter has a programmable option to be configured as low pass (default) or high pass. In default mode, the device operates in DDC mode 0, where the input is mixed with a constant frequency of  $-f_s / 4$  and transmitted as complex IQ. In DDC bypass mode (mode 8), the DDC is bypassed and the 2x decimated data are available on the JESD output. The different operational modes of the ADS54J64 are listed in [Table 1](#).

The ADS54J64 can also be operated in a dual-channel interleaved mode (dual mode), in which two channels are averaged and the 2x interleaved and averaged data are available directly at the JESD output.

### 7.3 Feature Description

#### 7.3.1 Analog Inputs

The ADS54J64 analog signal inputs are designed to be driven differentially. The analog input pins have internal analog buffers that drive the sampling circuit. As a result of the analog buffer, the input pins present a high-impedance input across a very wide frequency range to the external driving source that enables great flexibility in the external analog filter design as well as excellent 50-Ω matching for RF applications. The buffer also helps isolate the external driving circuit from the internal switching currents of the sampling circuit, resulting in a more constant SFDR performance across input frequencies. The common-mode voltage of the signal inputs is internally biased to 1.3 V using 2-kΩ resistors to allow for ac-coupling of the input drive network. Each input pin (INP, INM) must swing symmetrically between ( $V_{CM} + 0.275\text{ V}$ ) and ( $V_{CM} - 0.275\text{ V}$ ), resulting in a 1.1-V<sub>PP</sub> (default) differential input swing. The input sampling circuit has a 3-dB bandwidth that extends up to 1000 MHz.

#### 7.3.2 Recommended Input Circuit

In order to achieve optimum ac performance, the following circuitry (shown in Figure 46) is recommended at the analog inputs.

Copyright © 2017, Texas Instruments Incorporated

Figure 46. Analog Input Driving Circuit

#### 7.3.3 Clock Input

The clock inputs of the ADS54J64 supports LVDS and LVPECL standards. The CLKP, CLKM inputs have an internal termination of 100 Ω. The clock inputs must be ac-coupled, as shown in Figure 47 and Figure 48, because the input pins are self-biased to a common-mode voltage of 0.7 V.

## 7.4 Device Functional Modes

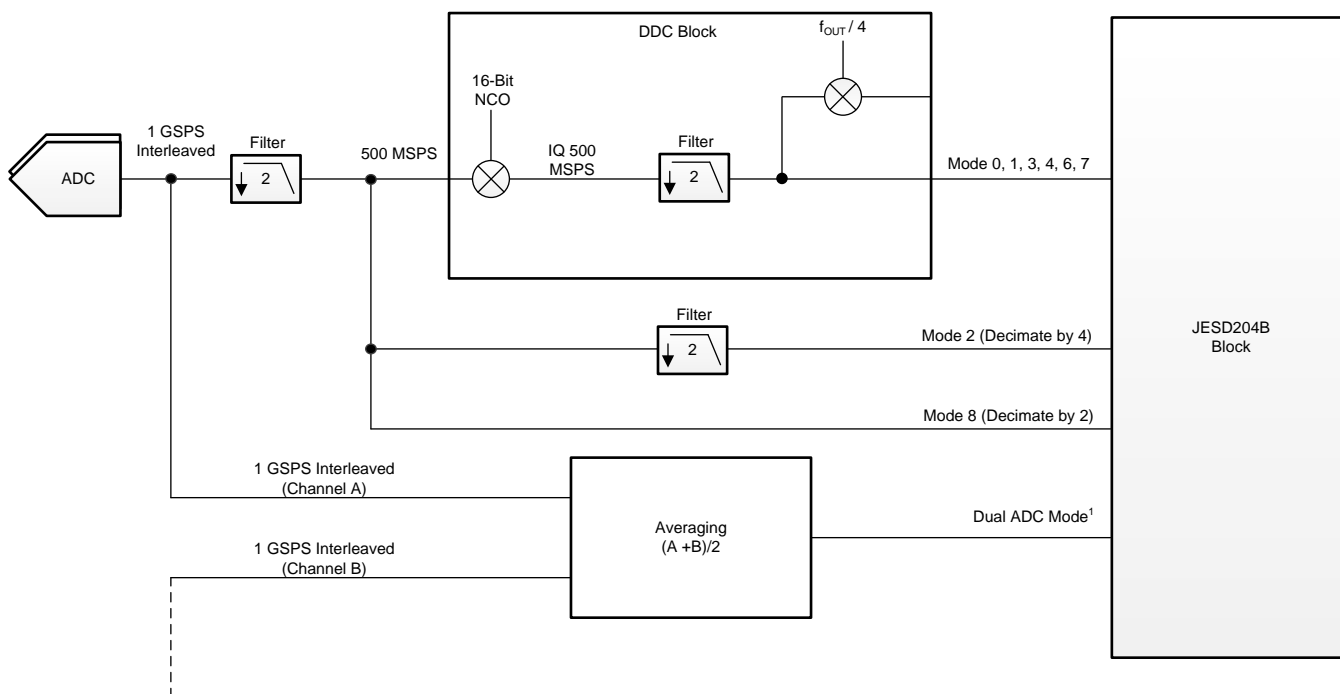

### 7.4.1 Digital Functions

Figure 49 shows the various operational modes available in the ADS54J64. In quad mode, the maximum output rate is half the sampling rate. The 2x interleaved data are filtered using a half-band filter (HBF) that can be configured as a low-pass or high-pass filter using register writes. In dual mode, the device can be operated at a full sampling rate with 2x interleaving and averaging of two channels.

Quad mode supports a maximum complex and a real bandwidth of 200 MHz. The HBF output can be brought directly on the JESD lines at half rate. The complex data are obtained through a digital down-converter (DDC) that is comprised of a 16-bit numerically controlled oscillator (NCO) and a 100-MHz or 200-MHz filter. The DDC also has a real output mode where the data are decimated by 2 and mixed to  $f_{OUT} / 4$  to support a bandwidth of 100 MHz. In addition to the DDC modes, the HBF output can be decimated by 2 to obtain an overall decimation by 4 on the 2x interleaved data.

Dual mode supports a maximum sampling rate of 1 GSPS. The 2x interleaved data from channel A and channel B (and likewise channels C and D) can be averaged and given on the JESD lanes.

Table 1 lists all modes of operation with the maximum bandwidth provided at a sample rate of 491.52 MSPS and 368.64 MSPS.

7.4.1.1 Numerically Controlled Oscillators (NCOs) and Mixers

The ADS54J64 is equipped with a complex numerically-controlled oscillator. The oscillator generates a complex exponential sequence:  $x[n] = e^{j\omega n}$ . The frequency ( $\omega$ ) is specified by the 16-bit register setting. The complex exponential sequence is multiplied by the real input from the ADC to mix the desired carrier down to 0 Hz.

The NCO frequency setting is set by the 16-bit register value, NCO\_FREQ[n]:

$$f_{NCO} = \frac{\text{NCO Frequency [n]} \times f_s}{2^{16}} \tag{1}$$

7.4.1.2 Decimation Filter

The ADS54J64 has two decimation filters (decimate-by-2) in the data path. The first stage of the decimation filter is non-programmable and is used in all functional modes. The second stage of decimation, available in DDC mode 2 and 6, can be used to obtain noise and linearity improvement for low bandwidth applications.

7.4.1.2.1 Stage-1 Filter

The first-stage filter is used for decimation of the 2x interleaved data from  $f_{CLK}$  to  $f_{CLK} / 2$ . Figure 50 and Figure 51 show the frequency response and pass-band ripple of the first-stage decimation filter, respectively.

7.4.1.2.2 Stage-2 Filter

The second-stage filter is used for decimating the data from a sample rate of  $f_{CLK} / 2$  to  $f_{CLK} / 4$ . Figure 52 and Figure 53 show the frequency response and pass-band ripple of the second-stage filter, respectively.

7.4.1.3 Mode 0: Decimate-by-4 With IQ Outputs and  $f_s / 4$  Mixer

In mode 0, the DDC block includes a fixed frequency  $\pm f_s / 4$  complex digital mixer preceding the second-stage decimation filters. Figure 54 shows that the IQ pass band is approximately  $\pm 100$  MHz centered at  $f_s / 8$  or  $3f_s / 8$ .

**7.4.1.4 Mode 1: Decimate-by-4 With IQ Outputs and 16-Bit NCO**

In mode 1, the DDC block includes a 16-bit frequency resolution complex digital mixer, as shown in Figure 55, preceding the second-stage decimation filters.

Figure 55. Operating Mode 1

**7.4.1.5 Mode 2: Decimate-by-4 With Real Output**

In mode 2, the DDC block cascades two decimate-by-2 filters. Each filter can be configured as low pass (LP) or high pass (HP), as shown in Table 2, to allow down conversion of different frequency ranges. Figure 56 shows that the LP, HP and HP, LP output spectra are inverted.

Figure 56. Operating in Mode 2

Table 2. ADS54J64 Operating Mode 2, Down-Converted Frequency Ranges

1ST-STAGE FILTER	2ND-STAGE FILTER	FREQUENCY RANGE WITH CLOCK RATE OF 983.04 MHz	BANDWIDTH WITH CLOCK RATE OF 983.04 MHz	FREQUENCY RANGE WITH CLOCK RATE OF 737.28 MHz	BANDWIDTH WITH CLOCK RATE OF 737.28 MHz
LP	LP	0 MHz–100 MHz	100 MHz	0 MHz–75 MHz	75 MHz

### 7.4.1.6 Mode 3: Decimate-by-2 Real Output With Frequency Shift

In mode 3, the DDC block includes a 16-bit complex NCO digital mixer followed by a  $f_s / 4$  mixer with a real output to center the band at  $f_s / 4$ . As shown in Figure 57, the NCO must be set to a value different from  $\pm f_s / 4$ , or else the samples are zeroed.

Figure 57. Operating Mode 3

### 7.4.1.7 Mode 4: Decimate-by-4 With Real Output

In mode 4, the DDC block includes a 16-bit complex NCO digital mixer preceding the second-stage decimation filter. As shown in Figure 58, the signal is then mixed with  $f_{OUT} / 4$  to generate a real output. The bandwidth available in this mode is 100 MHz.

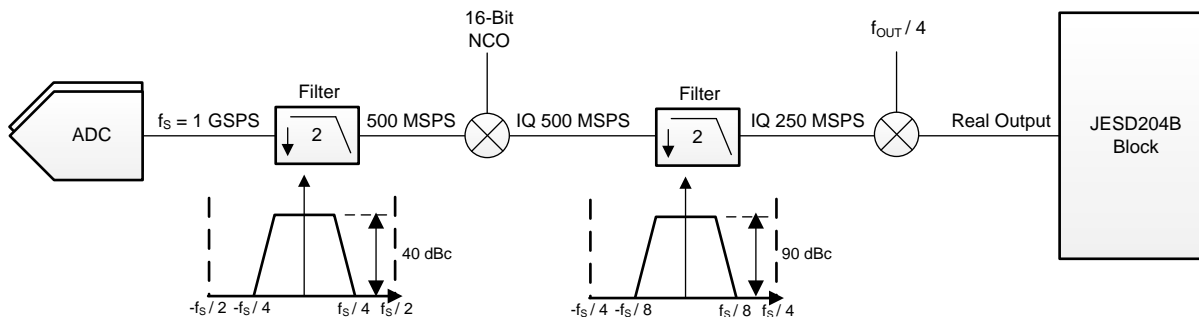

Figure 58. Operating Mode 4

**7.4.1.8 Mode 6: Decimate-by-4 With IQ Outputs for Up to 110 MHz of IQ Bandwidth**

In mode 6, the DDC block shown in Figure 59 includes a 16-bit complex NCO digital mixer preceding a second-stage filter with a decimate-by-4 complex, generating a complex output at  $f_s / 8$ .

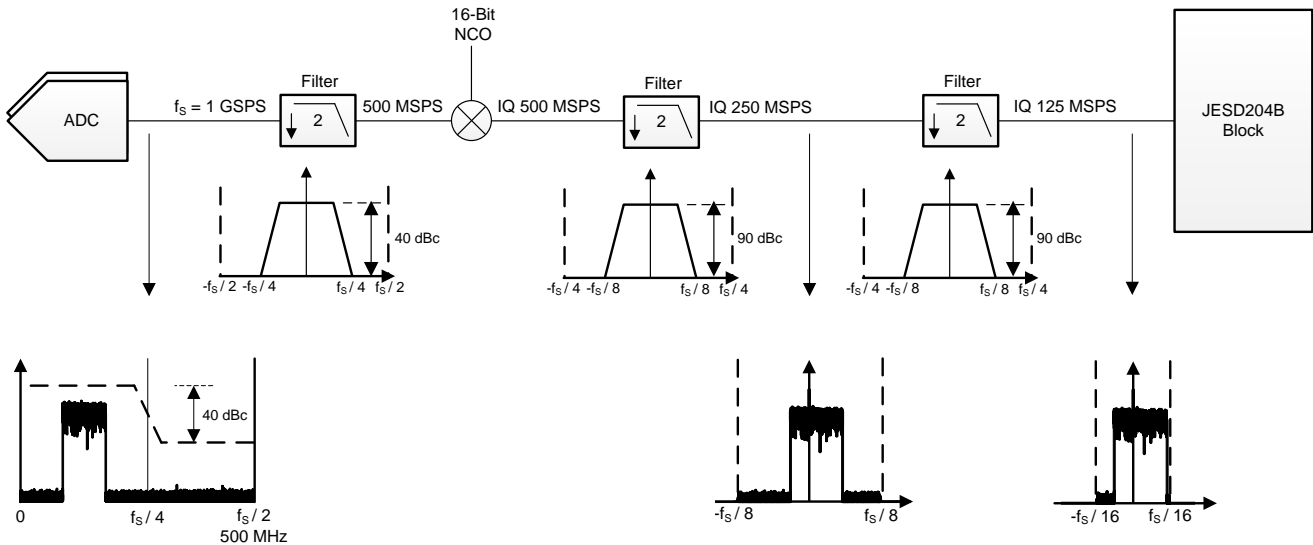

Figure 59. Operating Mode 6

**7.4.1.9 Mode 7: Decimate-by-4 With Real Output and Zero Stuffing**

In mode 7, the DDC block includes a 16-bit complex NCO digital mixer preceding the second-stage decimation filter. The signal is then mixed with  $f_{OUT} / 4$ , as shown in Figure 60, to generate a real output that is then doubled in sample rate by zero-stuffing every other sample. The bandwidth available in this mode is 100 MHz.

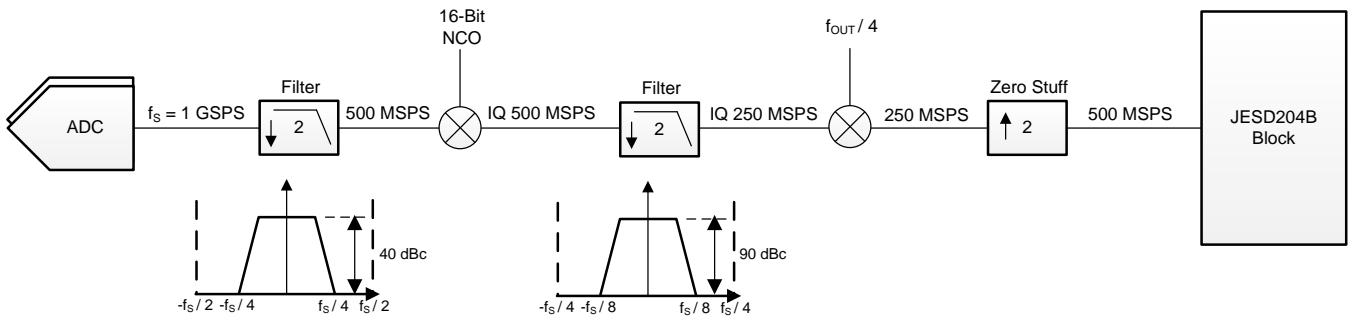

Figure 60. Operating Mode 7

### 7.4.1.10 Mode 8: DDC Bypass Mode

In mode 8, the DDC block is bypassed as shown in Figure 61 and the 2x decimated data are available on the JESD output. The decimation filter can be configured to be high pass or low pass using an SPI register bit. The stop-band attenuation is approximately 40 dB and the available bandwidth is 225 MHz. The decimation filter response is illustrated in Figure 50 and Figure 51.

Figure 61. Operating Mode 8

### 7.4.1.11 Averaging Mode

In dual ADC mode, two channels (channels A, B and C, D) are averaged and given out as a single output. As a result, the device operates in a dual-channel mode with 2x interleaved sample rate. For a 1-GSPS input clock, the averaged output at 1 GSPS is available on two JESD lanes, each operating at 10 Gbps. Figure 62 shows the device supporting an averaging of channels A and B. An identical averaging path is available for channels C and D. Configure the device in mode 8 before enabling dual ADC mode through SPI register writes.

Copyright © 2017, Texas Instruments Incorporated

Figure 62. Averaging Mode for Channels A and B (C and D Averaging is Identical)

### 7.4.1.12 Overrange Indication

The ADS54J64 provides a fast overrange indication that can be presented in the digital output data stream via SPI configuration. When the FOVR indication is embedded in the output data stream as shown in [Figure 63](#), this indication replaces the LSB (D0) of the 16 bits going to the 8b, 10b encode.

**Figure 63. FOVR Timing Diagram**

The fast overrange feature of the ADS54J64 is configured using an upper (FOVR Hi) and a lower (FOVR Lo) 8-bit threshold that are compared against the partial ADC output of the initial pipeline stages. [Figure 64](#) shows the FOVR high and FOVR low thresholds.

The two thresholds are configured via the SPI register where a setting of 136 maps to the maximum ADC code for a high FOVR, and a setting of 8 maps to the minimum ADC code for a low FOVR.

**Figure 64. FOVR High and FOVR Low Thresholds**

[Equation 2](#) calculates the FOVR threshold from a full-scale input based on the ADC code:

$$FOVR \text{ (dBFS)} = 20 \log \left| \frac{FOVR \text{ High or FOVR Low} - 72}{64} \right| \tag{2}$$

Therefore, a threshold of -0.5 dBFS from full-scale can be set with:

- FOVR high = 132 (27h, 84h)
- FOVR low = 12 (28h, 0Ch)

## 7.5 Programming

### 7.5.1 JESD204B Interface

The ADS54J64 supports device subclass 1 with a maximum output data rate of 10 Gbps for each serial transmitter.

Figure 65 shows that an external SYSREF signal is used to align all internal clock phases and the local multi-frame clock to a specific sampling clock edge. A common SYSREF signal allows synchronization of multiple devices in a system and minimizes timing and alignment uncertainty. The ADS54J64 supports single (for all four JESD links) or dual (for channels A, B and C, D) SYNCb inputs and can be configured via the SPI.

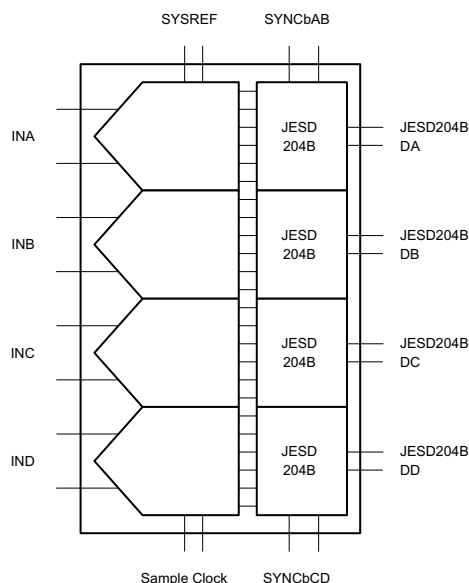

Figure 65. JESD204B Transmitter Block

Depending on the ADC sampling rate, the JESD204B output interface can be operated with one lane per channel. The JESD204B setup and configuration of the frame assembly parameters is handled via the SPI interface.

The JESD204B transmitter block shown in Figure 66 consists of the transport layer, the data scrambler, and the link layer. The transport layer maps the ADC output data into the selected JESD204B frame data format and manages if the ADC output data or test patterns are being transmitted. The link layer performs the 8b, 10b data encoding as well as the synchronization and initial lane alignment using the SYNC input signal. Optionally, data from the transport layer can be scrambled.

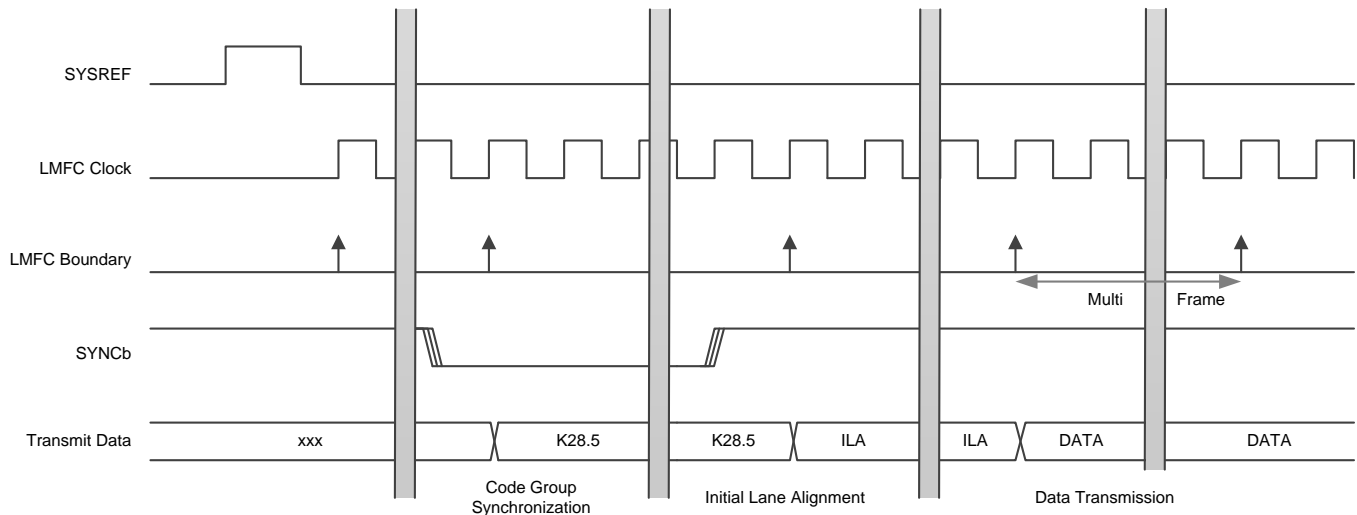

Figure 66. JESD Interface Block Diagram

## Programming (continued)

### 7.5.2 JESD204B Initial Lane Alignment (ILA)

The initial lane alignment process is started by the receiving device by deasserting the SYNCb signal. When a logic low is detected on the SYNC input pins, as shown in Figure 67, the ADS54J64 starts transmitting comma (K28.5) characters to establish code group synchronization.

When synchronization is complete, the receiving device reasserts the SYNCb signal and the ADS54J64 starts the initial lane alignment sequence with the next local multi-frame clock boundary. The ADS54J64 transmits four multi-frames, each containing K frames (K is SPI programmable). Each of the multi-frames contains the frame start and end symbols and the second multi-frame also contains the JESD204 link configuration data.

**Figure 67. ILA Sequence**

## Programming (continued)

### 7.5.3 JESD204B Frame Assembly

The JESD204B standard defines the following parameters:

- L is the number of lanes per link
- M is the number of converters per device
- F is the number of octets per frame clock period
- S is the number of samples per frame

Table 3 lists the available JESD204B formats and valid ranges for the ADS54J64. The ranges are limited by the SerDes line rate and the maximum ADC sample frequency.

**Table 3. Available JESD204B Formats and Valid Ranges for the ADS54J64**

L	M	F	S	OPERATING MODE	DIGITAL MODE	OUTPUT FORMAT	MAX ADC OUTPUT RATE (MSPS)	MAX $f_{SerDes}$ (Gbps)	JESD PLL REGISTER CONFIGURATION

DC	CD <sup>(2)</sup> <sub>0</sub> [15:8]	CD <sub>1</sub> [15:8]	CD <sub>2</sub> [15:8]	CD <sub>3</sub> [15:8]
DD	CD <sub>0</sub> [7:0]	CD <sub>1</sub> [7:0]	CD <sub>2</sub> [7:0]	CD <sub>3</sub> [7:0]

- (1) AB corresponds to the average output of channel A and channel B.  
(2) CD corresponds to the average output of channel C and channel D.

### 7.5.4 JESD Output Switch

To ease layout constraints, the ADS54J64 provides a digital cross-point switch in the JESD204B block (as shown in Figure 68) that allows internal routing of any output of the two ADCs within one channel pair to any of the two JESD204B serial transmitters. The cross-point switch routing is configured via the SPI (address 41h in the SERDES\_XX digital page).

Figure 68. Switching the Output Lanes

#### 7.5.4.1 SerDes Transmitter Interface

As shown in Figure 69, each 10-Gbps SerDes transmitter output requires ac-coupling between the transmitter and receiver. Terminate the differential pair with  $100\ \Omega$  as close to the receiving device as possible to avoid unwanted reflections and signal degradation.

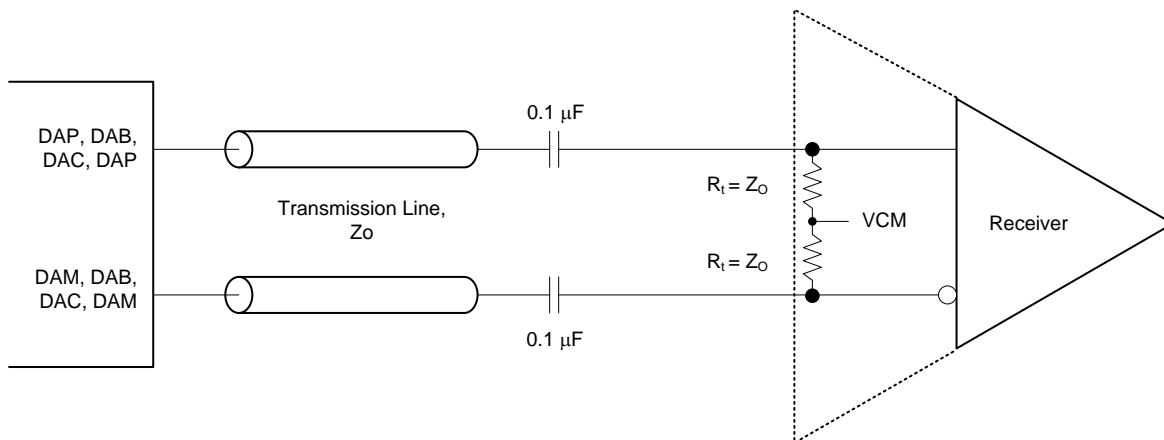

Figure 69. SerDes Transmitter Connection to Receiver

#### 7.5.4.2 SYNCb Interface

The ADS54J64 supports single SYNCb control (where the SYNCb input controls all four JESD204B links) or dual SYNCb control (where one SYNCb input controls two JESD204B lanes: DA, DB and DC, DD). When using the single SYNCb control, connect the unused input to a differential logic high (SYNCbxxP = DVDD, SYNCbxxM = 0 V).

### 7.5.4.3 Eye Diagram

Figure 70 to Figure 73 show the serial output eye diagrams of the ADS54J64 at 7.5 Gbps and 10 Gbps with default and increased output voltage swing against the JESD204B mask.

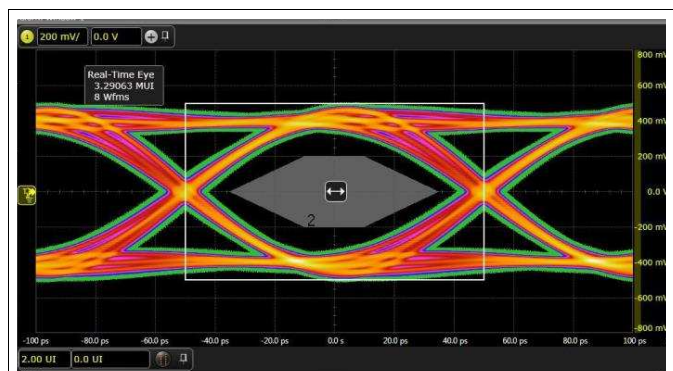

Figure 70. Eye at 10-Gbps Bit Rate With Default Output Swing

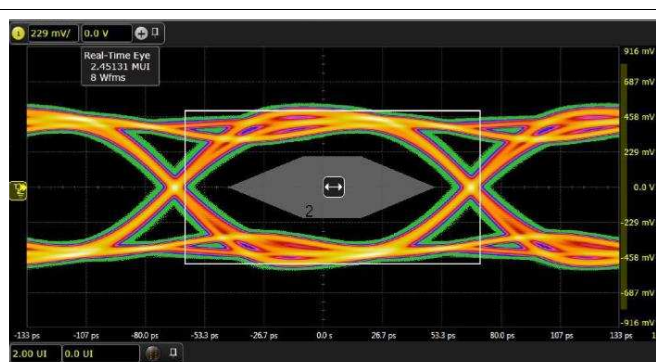

Figure 71. Eye at 7.5-Gbps Bit Rate With Default Output Swing

Figure 72. Eye at 10-Gbps Bit Rate With Increased Output Swing

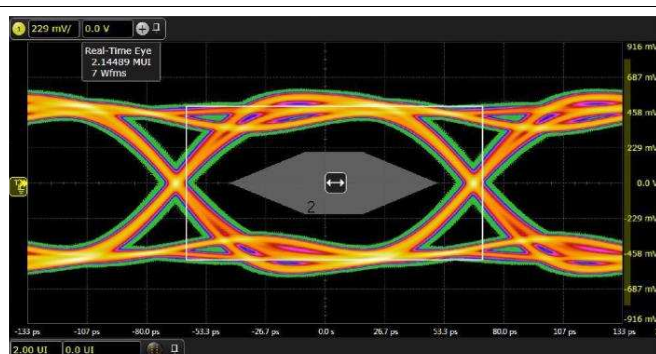

Figure 73. Eye at 7.5-Gbps Bit Rate With Increased Output Swing

## 7.5.5 Device Configuration

The ADS54J64 can be configured using a serial programming interface, as described in the [Register Maps](#) section. In addition, the device has one dedicated parallel pin (PDN) for controlling the power-down modes. The ADS54J64 supports a 24-bit (16-bit address, 8-bit data) SPI operation and uses paging to access all register bits.

### 7.5.5.1 Details of the Serial Interface

The ADC has a set of internal registers that can be accessed by the serial interface formed by the SEN (serial interface enable), SCLK (serial interface clock), SDIN (serial data input data), and SDOUT (serial data output) pins. Serially shifting bits into the device is enabled when SEN is low. SDIN serial data are latched at every SCLK rising edge when SEN is active (low). Data can be loaded in multiples of 24-bit words within a single active SEN pulse. The first 16 bits form the register address and the remaining eight bits are the register data. The interface can work with SCLK frequencies from 10 MHz down to very low speeds (of a few hertz) and also with a non-50% SCLK duty cycle.

#### 7.5.5.1.1 Register Initialization

After power-up, the internal registers must be initialized to the default values. This initialization can be accomplished in one hardware reset by applying a high pulse on the RESET pin.

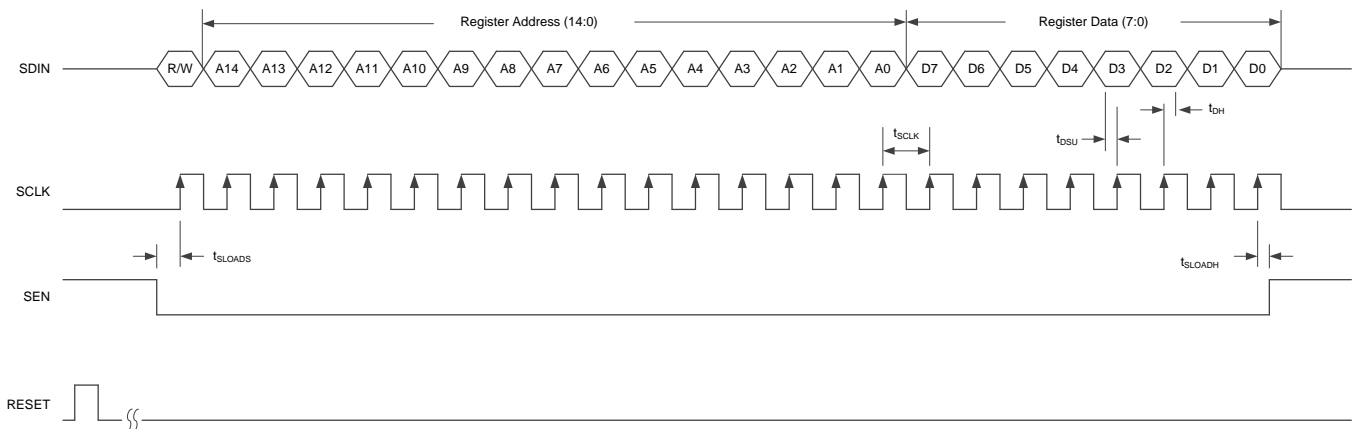

### 7.5.5.2 Serial Register Write

The internal registers of the ADS54J64 can be programmed (as shown in [Figure 74](#)) by:

1. Driving the SEN pin low
2. Setting the R/W bit = 0
3. Initiating a serial interface cycle specifying the address of the register (A[14:0]) whose content must be written
4. Writing the 8-bit data that is latched in on the SCLK rising edge

The ADS54J64 has several different register pages (page selection in address 11h, 12h). Specify the register page before writing to the desired address. The register page only must be set one time for continuous writes to the same page.

During the write operation, the SDOOUT pin is in a high-impedance mode and must float.

**Figure 74. Serial Interface Write Timing Diagram**

### 7.5.5.3 Serial Read

Figure 75 shows a typical 4-wire serial register readout. In the default 4-pin configuration, the SDIN pin is the data output from the ADS54J64 during the data transfer cycle when SDOUT is in a high-impedance state. The internal registers of the ADS54J64 can be read out by:

1. Driving the SEN pin low
2. Setting the R/W bit to 1 to enable read back
3. Specifying the address of the register (A[14:0]) whose content must be read back
4. The device outputs the contents (D[7:0]) of the selected register on the SDOUT pin (pin 51)
5. The external controller can latch the contents at the SCLK rising edge

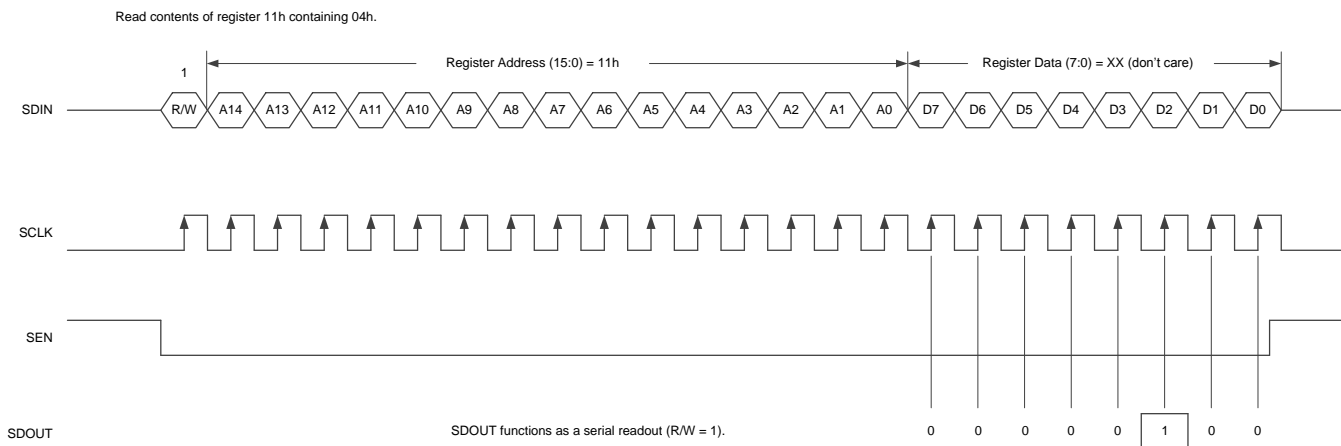

Figure 75. Serial Interface 4-Wire Read Timing Diagram

## 7.6 Register Maps

### 7.6.1 Register Map

The ADS54J64 registers are organized on different pages depending on their internal functions. The pages are accessed by selecting the page in the master pages 11h–13h. The page selection must only be written one time for a continuous update of registers for that page.

There are six different SPI banks (see [Figure 76](#) and [Table 7](#)) that group together different functions:

- GLOBAL: contains controls for accessing other SPI banks
- DIGTOP: top-level digital functions
- ANALOG: registers controlling power-down and analog functions
- SERDES\_XX: registers controlling JESD204B functions
- CHX: registers controlling channel-specific functions, including DDC
- ADCXX: register page for one of the eight interleaved ADCs

Bit	Field	Type	Reset	Description
7	CTRL_K	R/W	0h	This bit is the enable bit for programming the number of frames per multi-frame. 0 : Five frames per multi-frame (default) 1 : Frames per multi-frame can be programmed using register 26h
6	CTRL_SER_MODE	R/W	0h	This bit allows the SERDES_MODE setting in register 21h (bits 1-0) to be changed. 0 : Disabled 1 : Enables SERDES_MODE setting
5	0	R/W	0h	Must read or write 0
4	TRANS_TEST_EN	R/W	0h	This bit generates the long transport layer test pattern mode, as per section 5.1.6.3 of the JESD204B specification. 0 : Test mode is disabled 1 : Test mode is enabled
3	0	R/W	0h	Must read or write 0
2	LANE_ALIGN	R/W	0h	This bit inserts the lane-alignment character (K28.3) for the receiver to align to the lane boundary, as per section 5.3.3.5 of the JESD204B specification. 0 : Normal operation 1 : Inserts lane-alignment characters
1	FRAME_ALIGN	R/W	0h	This bit inserts the frame-alignment character (K28.7) for the receiver to align to the lane boundary, as per section 5.3.3.5 of the JESD204B specification. 0 : Normal operation 1 : Inserts frame-alignment characters
0	TX_ILA_DIS	R/W	0h	This bit disables sending the initial link alignment (ILA) sequence when SYNC is deasserted. 0 = Normal operation 1 = Disables ILA

**7.6.1.1.4.2 Register 21h (address = 21h) [reset = 0h], SERDES\_XX Page**
**Figure 108. Register 21h**

7	6	5	4	3	2	1	0
SYNC_REQ	OPT_SYNC_REQ	SYNCB_SEL_AB_CD	0	0	0	SERDES_MODE	
R/W-0h	R/W-0h	R/W-0h	R/W-0h	R/W-0h	R/W-0h	R/W-0h	

**Table 40. Register 21h Field Descriptions**

Bit	Field	Type	Reset	Description
7	SYNC_REQ	R/W	0h	This bit controls the SYNC register (bit 6 must be enabled). 0 : Normal operation 1 : ADC output data are replaced with K28.5 characters
6	OPT_SYNC_REQ	R/W	0h	This bit enables SYNC operation. 0 : Normal operation 1 : Enables SYNC from the SYNC_REQ register bit
5	SYNCB_SEL_AB_CD	R/W	0h	This bit selects which SYNCb input controls the JESD interface. 0 : Use the SYNCbAB, SYNCbCD pins 1 : When set in the SerDes AB SPI, SYNCbCD is used for the SerDes AB and CD; when set in the SerDes CD SPI, SYNCbAB is used for the SerDes AB and CD
4-2	0	R/W	0h	Must read or write 0
1-0	SerDes_MODE	R/W	0h	These bits set the JESD output parameters. The CTRL_SER_MODE bit (register 20h, bit 6) must also be set to control these bits. These bits are auto configured for modes 0, 1, 3, and 7, but must be configured for modes 2, 4, and 6.

**7.6.1.1.4.3 Register 22h (address = 22h) [reset = 0h], SERDES\_XX Page**
**Figure 109. Register 22h**

7	6	5	4	3	2	1	0
LINK_LAYER_TESTMODE_SEL		RPAT_SET_DISP		LMFC_MASK_RESET	0	0	0

**Table 41. Register 22h Field Descriptions**

Bit	Field	Type	Reset	Description
7-5	LINK_LAYER_TESTMODE_SEL	R/W	0h	These bits generate a pattern as per section 5.3.3.8.2 of the JESD204B document. 0 : Normal ADC data 1 : D21.5 (high-frequency jitter pattern) 2 : K28.5 (mixed-frequency jitter pattern) 3 : Repeat the initial lane alignment (generates a K28.5 character and continuously repeats lane alignment sequences) 4 : 12-octet RPAT jitter pattern 6 : PRBS pattern (PRBS7, 15, 23, 31); use PRBS_MODE (register 36h, bits 7-6) to select the PRBS pattern
4	RPAT_SET_DISP	R/W	0h	This bit changes the running disparity in the modified RPAT pattern test mode (only when the link layer test mode = 100). 0 : Normal operation 1 : Changes disparity
3	LMFC_MASK_RESET	R/W	0h	0 : Default 1 : Resets the LMFC mask
2-0	0	R/W	0h	Must read or write 0

**7.6.1.1.4.4 Register 23h (address = 23h) [reset = 0h], SERDES\_XX Page**

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

#### 8.1.1 Start-Up Sequence

Table 62 lists the recommended start-up sequence for a 500-MSPS, Nyquist 2 operation with DDC mode 8 enabled.

**Table 62. Recommended Start-Up Sequence for 500-MSPS, Nyquist 2, DDC Bypass Mode (Mode 8) Operation**

STEP	DESCRIPTION	REGISTER ADDRESS	REGISTER DATA	COMMENT	
1	Provide a 1.15-V power supply (AVDD, DVDD)	—	—	—	
2	Provide a 1.9-V power supply (AVDD19)	—	—	A 1.15-V supply must be supplied first for proper operation.	
3	Provide a clock to CLKINM, CLKINP and a SYSREF signal to SYSREFM, SYSREFP	—	—	SYSREF must be established before SPI programming.	
4	Pulse a reset (low to high to low) via a hardware reset (pin 48), wait 100 $\mu$ s	—	—	Hardware reset loads all trim register settings.	
5	Issue a software reset to initialize the registers	00h	81h	—	
6	Set the high SNR mode for channel pairs AB and CD, select trims for 500-MSPS operation	11h	00h	Select the DIGTOP page.	
		12h	01h		
		13h	00h		
		ABh	01h	Set the high SNR mode for channels A and B.	
		ACH	01h	Set the high SNR mode for channels C and D.	
		ADh	08h	Select DDC bypass mode (mode 8) for channels A and B.	
		A Eh	08h	Select DDC bypass mode (mode 8) for channels C and D.	
7	Set up the SerDes configuration	64h	02h	Select trims for 500-MSPS operation.	
		11h	00h	Select the SerDes_AB and SerDes_CD pages.	
		12h	60h		
		13h	00h		
		26h	0Fh	Set the K value to 16 frames per multi-frame.	
20h	80h	Enable the K value from register 26h.			
8	ADC calibration	11h	FFh	Select the ADC_A1, ADC_A2, ADC_B1, ADC_B2, ADC_C1, ADC_C2, ADC_D1, and ADC_D2 pages.	
		12h	00h		
		13h	00h		
		D5h	08h	Enable ADC calibration.	
		Wait 2 ms		ADC calibration time.	
		D5h	00h	Disable ADC calibration.	
		2Ah	00h	Internal trims.	
CFh	50h				
9	Select trims for the second Nyquist	11h	00h	Select the channel A, channel B, channel C, and channel D pages.	
		12h	1Eh		
		13h	00h		
		2Dh	02h	Select trims for the second Nyquist.	

**Application Information (continued)**
**Table 62. Recommended Start-Up Sequence for 500-MSPS, Nyquist 2, DDC Bypass Mode (Mode 8) Operation (continued)**

STEP	DESCRIPTION	REGISTER ADDRESS	REGISTER DATA	COMMENT
10	Load linearity trims	11h	00h	Select the DIGTOP page.
		12h	01h	
		13h	00h	
		8Ch	02h	Load linearity trims.
		B7h	01h	
		B7h	00h	
11	Disable SYSREF	11h	00h	Select the ANALOG page.
		12h	00h	
		13h	01h	
		6Ah	02h	Disable SYSREF.

Table 63 lists the recommended start-up sequence for a 500-MSPS, Nyquist 2, 2x interleaved dual ADC operation.

**Table 63. Recommended Start-Up Sequence for 500-MSPS, Nyquist 2, 2x Interleaved Dual ADC Operation**

STEP	DESCRIPTION	REGISTER ADDRESS	REGISTER DATA	COMMENT
1	Provide a 1.15-V power supply (AVDD, DVDD)	—	—	—
2	Provide a 1.9-V power supply (AVDD19)	—	—	A 1.15-V supply must be supplied first for proper operation.
3	Provide a clock to CLKINM, CLKINP and a SYSREF signal to SYSREFM, SYSREFP	—	—	SYSREF must be established before SPI programming.
4	Pulse a reset (low to high to low) via a hardware reset (pin 48), wait 100 $\mu$ s	—	—	Hardware reset loads all trim register settings.
5	Issue a software reset to initialize the registers	00h	81h	—

### 8.1.2 Hardware Reset

Figure 130 shows the timing information for the hardware reset.

Figure 130. Hardware Reset Timing Diagram

Table 64. Timing Requirements for Figure 130

		MIN	TYP	MAX	UNIT
t <sub>1</sub>	Power-on delay from power-up to an active high RESET pulse	1			ms
t <sub>2</sub>	Reset pulse duration: active high RESET pulse duration	10			ns
t <sub>3</sub>	Register write delay from RESET disable to SEN active	100			μs

### 8.1.3 Frequency Planning

The ADS54J64 uses an architecture where the ADCs are 2x interleaved followed by a digital decimation by 2. The 2x interleaved and decimation architecture comes with a unique advantage of improved linearity resulting from frequency planning. Frequency planning refers to choosing the clock frequency and signal band appropriately such that the harmonic distortion components, resulting from the analog front-end (LNA, PGA), can be made to fall outside the decimation filter pass band. In absence of the 2x interleave and decimation architecture, these components alias back in band and limit the performance of the signal chain. For example, for  $f_{CLK} = 983.04$  MHz and  $f_{IN} = 184.32$  MHz:

$$\text{Second-order harmonic distortion (HD2)} = 2 \times 184.32 = 368.64 \text{ MHz}$$

$$\text{Pass band of the 2x decimation filter} = 0 \text{ MHz to } 245.76 \text{ MHz (0 to } f_{CLK} / 4)$$

The second-order harmonic performance improves by the stop-band attenuation of the filter (approximately 40 dBc) because the second-order harmonic frequency is outside the pass band of the decimation filter.

Figure 131 shows the harmonic components (HD2–HD5) that fall in the decimation pass band for the input clock rate ( $f_{CLK}$ ) of the 983.04-MHz and 100-MHz signal band around the center frequency of 184.32 MHz.

NOTE:  $f_{CLK}$  = 983.04 MHz, signal band = 134.32 MHz to 234.32 MHz.

**Figure 131. In-Band Harmonics for a Frequency Planned System**

As shown in Figure 131, both HD2 and HD3 are completely out of band. HD4 and HD5 fall in the decimation pass band for some frequencies of the input signal band.

Through proper frequency planning, the specifications of the ADC antialias filter can be relaxed.

### 8.1.4 SNR and Clock Jitter

The signal-to-noise ratio of the ADC is limited by three different factors (as shown in Equation 3): the quantization noise is typically not noticeable in pipeline converters and is 84 dB for a 14-bit ADC. The thermal noise limits the SNR at low input frequencies and the clock jitter sets the SNR for higher input frequencies.

$$SNR_{ADC} [dBc] = -20 \log \sqrt{\left(10^{-\frac{SNR_{Quantization\ Noise}}{20}}\right)^2 + \left(10^{-\frac{SNR_{Thermal\ Noise}}{20}}\right)^2 + \left(10^{-\frac{SNR_{Jitter}}{20}}\right)^2} \quad (3)$$

Equation 4 calculates the SNR limitation resulting from sample clock jitter:

$$SNR_{jitter} [dBc] = -20 \log(2\pi \times f_{in} \times T_{jitter}) \quad (4)$$

The total clock jitter ( $T_{Jitter}$ ) has two components: the internal aperture jitter ( $100 f_S$  for the ADS54J64) that is set by the noise of the clock input buffer and the external clock jitter. Equation 5 calculates  $T_{Jitter}$ :

$$T_{jitter} = \sqrt{(T_{jitter, Ext\_Clock\_Input})^2 + (T_{Aperture\_ADC})^2} \quad (5)$$

External clock jitter can be minimized by using high-quality clock sources and jitter cleaners as well as band-pass filters at the clock input; a faster clock slew rate also improves the ADC aperture jitter.

The ADS54J64 has a thermal noise of approximately 70 dBFS and an internal aperture jitter of  $100 f_S$ .

### 8.1.5 ADC Test Pattern

The ADS54J64 provides several different options to output test patterns instead of the actual output data of the ADC in order to simplify debugging of the JESD204B digital interface link. Figure 132 shows the output data path.

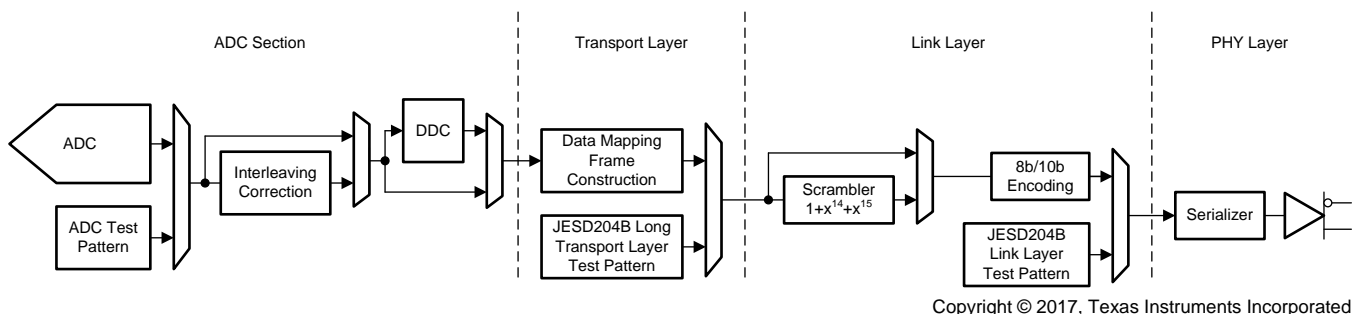

Figure 132. ADC Test Pattern

#### 8.1.5.1 ADC Section

The ADC test pattern replaces the actual output data of the ADC. These test patterns can be programmed using register 91h of the DIGTOP page. Table 65 lists the supported test patterns.

Table 65. ADC Test Pattern Settings

BIT	NAME	DEFAULT	DESCRIPTION
7-4	TESTPATTERNSELECT	0000	These bits select the test pattern on the output when the test pattern is enabled for a suitable channel. 0 : Default 1 : All zeros 2 : All ones 3 : Toggle pattern 4 : Ramp pattern 6 : Custom pattern 1 7 : Toggles between custom pattern 1 and custom pattern 2 8 : Deskew pattern (AAAAh)

#### 8.1.5.2 Transport Layer Pattern

The transport layer maps the ADC output data into 8-bit octets and constructs the JESD204B frames using the LMFS parameters. Tail bits or 0s are added when needed. Alternatively, as shown in Table 66, the JESD204B long transport layer test pattern can be substituted by programming register 20h.

Table 66. Transport Layer Test Mode

BIT	NAME	DEFAULT	DESCRIPTION
4	TRANS_TEST_EN	0	This bit generates the long transport layer test pattern mode according to clause 5.1.6.3 of the JESD204B specification. 0 = Test mode disabled 1 = Test mode enabled

### 8.1.5.3 Link Layer Pattern

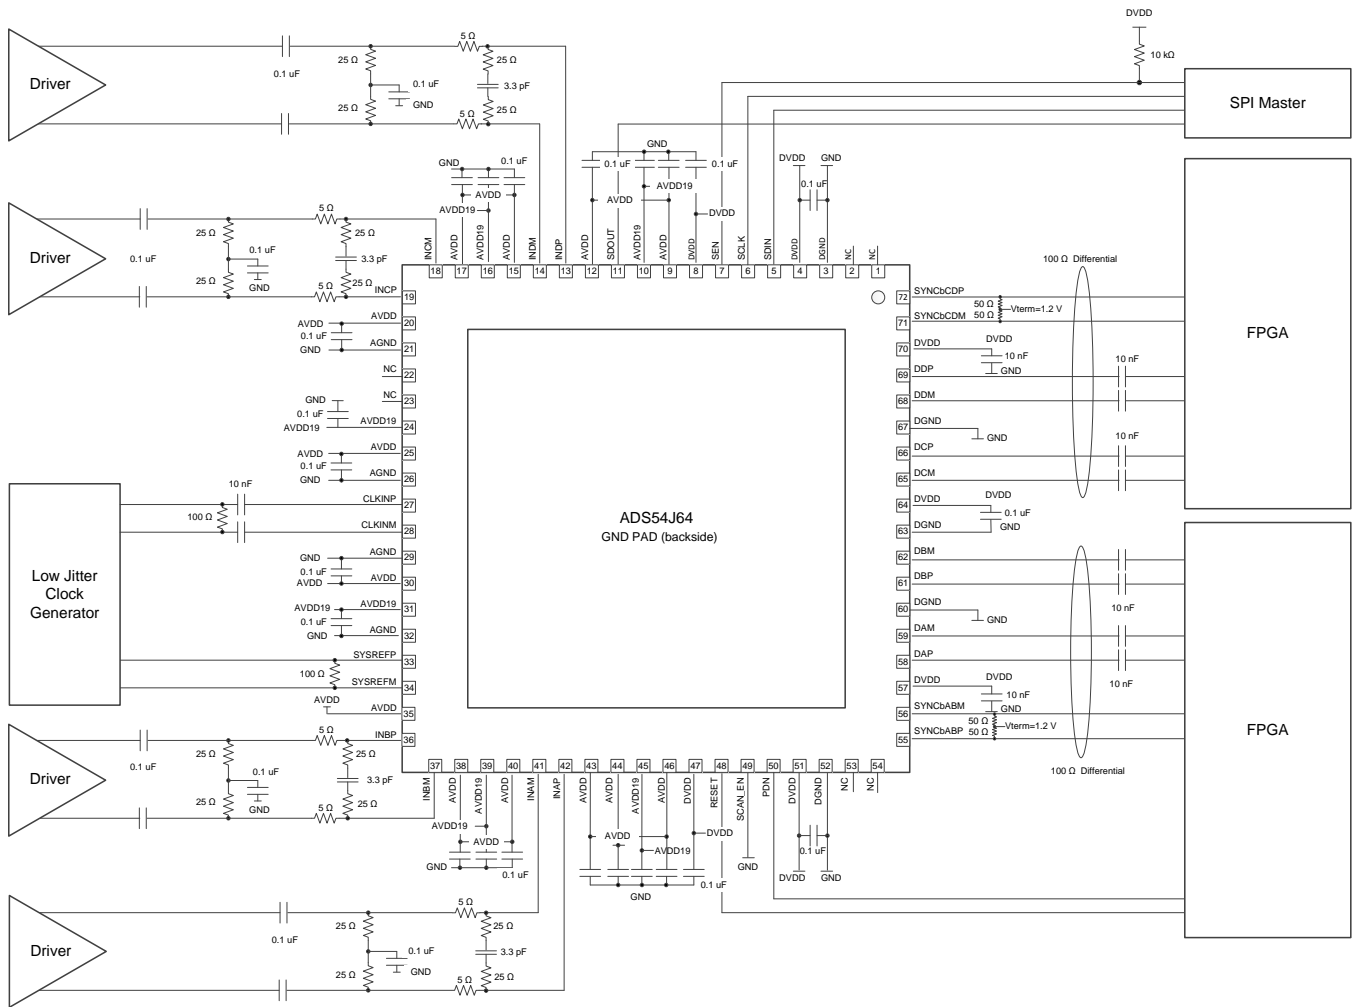

The link layer contains the scrambler and the 8b, 10b encoding of any data passed on from the transport layer. Additionally, the link layer also handles the initial lane alignment sequence that can be manually restarted. The link layer test patterns are intended for testing the quality of the link (jitter testing and so forth). The test patterns do not pass through the 8b, 10b encoder. These test patterns can be used by programming register 22h of the SERDES\_XX page. [Table 67](#) shows the supported programming options.

**Table 67. Link Layer Test Mode**

BIT	NAME	DEFAULT	DESCRIPTION
7-5	LINK_LAYER_TESTMODE_SEL	000	These bits generate a pattern according to clause 5.3.3.8.2 of the JESD204B document. 0 : Normal ADC data 1 : D21.5 (high-frequency jitter pattern) 2 : K28.5 (mixed-frequency jitter pattern) 3 : Repeats initial lane alignment (generates a K28.5 character and continuously repeats lane alignment sequences) 4 : 12-octet RPAT jitter pattern 6 : PRBS pattern (PRBS7,15,23,31); use PRBS mode (register 36h) to select the PRBS pattern

## 8.2 Typical Application

The ADS54J64 is designed for wideband receiver applications demanding excellent dynamic range over a large input frequency range. [Figure 133](#) shows a typical schematic for an ac-coupled dual receiver [dual field-programmable gate array (FPGA) with a dual SYNC].

Copyright © 2017, Texas Instruments Incorporated

NOTE: GND = AGND and DGND are connected in the PCB layout.

**Figure 133. Application Diagram for the ADS54J64**

### 8.2.1 Design Requirements

By using the simple drive circuit of [Figure 133](#) (when the amplifier drives the ADC) or [Figure 46](#) (when transformers drive the ADC), uniform performance can be obtained over a wide frequency range. The buffers present at the analog inputs of the device help isolate the external drive source from the switching currents of the sampling circuit.

### 8.2.2 Detailed Design Procedure

For optimum performance, the analog inputs must be driven differentially. This architecture improves the common-mode noise immunity and even-order harmonic rejection. A small resistor (5  $\Omega$  to 10  $\Omega$ ) in series with each input pin, as shown in [Figure 133](#), is recommended to damp out ringing caused by package parasitics.

## Typical Application (continued)

### 8.2.3 Application Curves

Figure 134 and Figure 135 show the typical performance at 190 MHz and 230 MHz, respectively.

## 9 Power Supply Recommendations

The device requires a 1.15-V nominal supply for DVDD, a 1.15-V nominal supply for AVDD, and a 1.9-V nominal supply for AVDD19. AVDD and DVDD are recommended to be powered up the before the AVDD19 supply for reliable loading of factory trims.

## 10 Layout

### 10.1 Layout Guidelines

The device evaluation module (EVM) layout can be used as a reference layout to obtain the best performance. [Figure 136](#) shows a layout diagram of the EVM top layer. A complete layout of the EVM is available at the [ADS54J64 EVM folder](#). Some important points to remember during board layout are:

- Analog inputs are located on opposite sides of the device pinout to ensure minimum crosstalk on the package level. To minimize crosstalk onboard, the analog inputs must exit the pinout in opposite directions, as shown in the reference layout of [Figure 136](#) as much as possible.
- In the device pinout, the sampling clock is located on a side perpendicular to the analog inputs in order to minimize coupling between them. This configuration is also maintained on the reference layout of [Figure 136](#) as much as possible.
- Keep digital outputs away from the analog inputs. When these digital outputs exit the pinout, the digital output traces must not be kept parallel to the analog input traces because this configuration can result in coupling from the digital outputs to the analog inputs and degrade performance. All digital output traces to the receiver [such as an FPGA or an application-specific integrated circuit (ASIC)] must be matched in length to avoid skew among outputs.
- At each power-supply pin (AVDD, DVDD, or AVDD19), keep a 0.1- $\mu$ F decoupling capacitor close to the device. A separate decoupling capacitor group consisting of a parallel combination of 10- $\mu$ F, 1- $\mu$ F, and 0.1- $\mu$ F capacitors can be kept close to the supply source.

## 11 Device and Documentation Support

### 11.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 11.2 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

**TI E2E™ Online Community** *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

**Design Support** *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

### 11.3 Trademarks

E2E is a trademark of Texas Instruments.  
All other trademarks are the property of their respective owners.

### 11.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 11.5 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
ADS54J64IRMP	ACTIVE	VQFN	RMP	72	168	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 85	AZ54J64	<a href="#">Samples</a>
ADS54J64IRMPT	ACTIVE	VQFN	RMP	72	250	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 85	AZ54J64	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**TRAY**

Chamfer on Tray corner indicates Pin 1 orientation of packed units.
