

# ADC1006S055/070

Single 10 bits ADC, up to 55 MHz or 70 MHz

Rev. 03 — 2 July 2012

Product data sheet

## 1. General description

---

The ADC1006S055/070 are a family of Bipolar CMOS (BiCMOS) 10-bit Analog-to-Digital Converters (ADC) optimized for a wide range of applications such as cellular infrastructures, professional telecommunications, imaging, and digital radio. It converts the analog input signal into 10-bit binary coded digital words at a maximum sampling rate of 70 MHz. All static digital inputs (SH,  $\overline{CE}$  and OTC) are Transistor-Transistor Logic (TTL) and CMOS compatible and all outputs are CMOS compatible. A sine wave clock input signal can also be used.

## 2. Features

---

- 10-bit resolution
- Sampling rate up to 70 MHz
- -3 dB bandwidth of 245 MHz
- 5 V power supplies and 3.3 V output power supply
- Binary or two's complement CMOS outputs
- In-range CMOS compatible output
- TTL and CMOS compatible static digital inputs
- TTL and CMOS compatible digital outputs
- Differential AC or Positive Emitter-Coupled Logic (PECL) clock input; TTL compatible
- Power dissipation 550 mW (typical)
- Low analog input capacitance (typical 2 pF), no buffer amplifier required
- Integrated sample-and-hold amplifier
- Differential analog input
- External amplitude range control
- Voltage controlled regulator included
- -40 °C to +85 °C ambient temperature

## 3. Applications

---

High-speed analog-to-digital conversion for:

- Cellular infrastructure
- Professional telecommunication
- Digital radio
- Radar
- Medical imaging
- Fixed network
- Cable modem

- Barcode scanner
- Cable Modem Termination System (CMTS)/Data Over Cable Service Interface Specification (DOCSIS)

## 4. Quick reference data

**Table 1. Quick reference data**

$V_{CCA} = V2$  to  $V44$ ,  $V3$  to  $V4$  and  $V41$  to  $V40 = 4.75$  V to  $5.25$  V;  $V_{CCD} = V37$  to  $V38$  and  $V15$  to  $V17 = 4.75$  V to  $5.25$  V;  $V_{CCO} = V33$  to  $V34 = 3.0$  V to  $3.6$  V; AGND and DGND shorted together;  $T_{amb} = -40$  °C to  $+85$  °C;  $V_{I(IN)(p-p)} - V_{I(INN)(p-p)} = 1.9$  V;  $V_{VREF} = V_{CCA3} - 1.75$  V;  $V_{I(cm)} = V_{CCA3} - 1.6$  V; typical values measured at  $V_{CCA} = V_{CCD} = 5$  V and  $V_{CCO} = 3.3$  V,  $T_{amb} = 25$  °C and  $C_L = 10$  pF; unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{CCA}$	analog supply voltage		4.75	5.0	5.25	V
$V_{CCD}$	digital supply voltage		4.75	5.0	5.25	V
$V_{CCO}$	output supply voltage		3.0	3.3	3.6	V
$I_{CCA}$	analog supply current		-	78	87	mA
$I_{CCD}$	digital supply current		-	27	30	mA
$I_{CCO}$	output supply current	$f_{clk} = 20$ MHz; $f_i = 400$ kHz	-	3	4	mA
INL	integral non-linearity	$f_{clk} = 20$ MHz; $f_i = 400$ kHz	-	$\pm 0.65$	$\pm 1.12$	LSB
DNL	differential non-linearity	$f_{clk} = 20$ MHz; $f_i = 400$ kHz (no missing code guaranteed)	-	$\pm 0.12$	$\pm 0.27$	LSB
$f_{clk(max)}$	maximum clock frequency	ADC1006S055H	55	-	-	MHz
		ADC1006S070H	70	-	-	MHz
$P_{tot}$	total power dissipation	$f_{clk} = 55$ MHz; $f_i = 20$ MHz	-	550	660	mW

## 5. Ordering information

**Table 2. Ordering information**

Type number	Package			Sampling frequency (MHz)
	Name	Description	Version	
ADC1006S055H	QFP44	plastic quad flat package; 44 leads (lead length 1.3 mm); body 10 × 10 × 1.75 mm	SOT307-2	55
ADC1006S070H	QFP44	plastic quad flat package; 44 leads (lead length 1.3 mm); body 10 × 10 × 1.75 mm	SOT307-2	70

## 7. Pinning information

### 7.1 Pinning

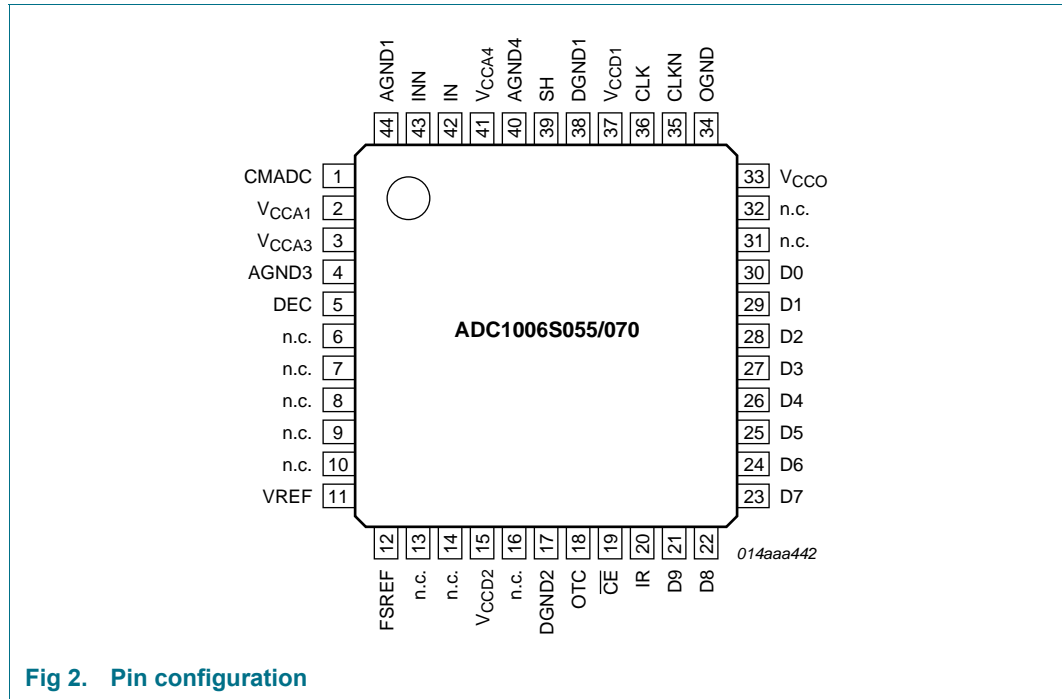

Fig 2. Pin configuration

### 7.2 Pin description

Table 3. Pin description

Symbol	Pin	Description
CMADC	1	regulator output common mode ADC input
V <sub>CCA1</sub>	2	analog supply voltage 1 (5 V)
V <sub>CCA3</sub>	3	analog supply voltage 3 (5 V)
AGND3	4	analog ground 3
DEC	5	decoupling node
n.c.	6	not connected
n.c.	7	not connected
n.c.	8	not connected
n.c.	9	not connected
n.c.	10	not connected
VREF	11	reference voltage input
FSREF	12	full-scale reference output
n.c.	13	not connected
n.c.	14	not connected
V <sub>CCD2</sub>	15	digital supply voltage 2 (5 V)
n.c.	16	not connected
DGND2	17	digital ground 2

**Table 3. Pin description ...continued**

Symbol	Pin	Description
OTC	18	control input two's complement output; active HIGH
$\overline{\text{CE}}$	19	chip enable input (CMOS level; active LOW)
IR	20	in-range output
D9	21	data output; bit 9 (Most Significant Bit (MSB))
D8	22	data output; bit 8
D7	23	data output; bit 7
D6	24	data output; bit 6
D5	25	data output; bit 5
D4	26	data output; bit 4
D3	27	data output; bit 3
D2	28	data output; bit 2
D1	29	data output; bit 1
D0	30	data output; bit 0 (Least Significant Bit (LSB))
n.c.	31	not connected
n.c.	32	not connected
V <sub>CCO</sub>	33	output supply voltage (3.3 V)
OGND	34	output ground
CLKN	35	complementary clock input
CLK	36	clock input
V <sub>CCD1</sub>	37	digital supply voltage 1 (5 V)
DGND1	38	digital ground 1
SH	39	sample-and-hold enable input (CMOS level; active HIGH)
AGND4	40	analog ground 4
V <sub>CCA4</sub>	41	analog supply voltage 4 (5 V)
IN	42	analog input voltage
INN	43	complementary analog input voltage
AGND1	44	analog ground 1

## 8. Limiting values

**Table 4. Limiting values**

*In accordance with the Absolute Maximum Rating System (IEC 60134).*

Symbol	Parameter	Conditions	Min	Max	Unit
V <sub>CCA</sub>	analog supply voltage		[1] -0.3	+7.0	V
V <sub>CCD</sub>	digital supply voltage		[1] -0.3	+7.0	V
V <sub>CCO</sub>	output supply voltage		[1] -0.3	+7.0	V
$\Delta V_{CC}$	supply voltage difference	$V_{CCA} - V_{CCD}$	-1.0	+1.0	V
		$V_{CCD} - V_{CCO}$	-1.0	+4.0	V
		$V_{CCA} - V_{CCO}$	-1.0	+4.0	V
V <sub>i(IN)</sub>	input voltage on pin IN	referenced to AGND	0.3	V <sub>CCA</sub>	V
V <sub>i(INN)</sub>	input voltage on pin INN		0.3	V <sub>CCA</sub>	V

**Table 4. Limiting values ...continued**

In accordance with the Absolute Maximum Rating System (IEC 60134).

Symbol	Parameter	Conditions	Min	Max	Unit
$V_{i(\text{clk})(p-p)}$	peak-to-peak clock input voltage	differential clock drive at pins 35 and 36	-	$V_{\text{CCD}}$	V
$I_{\text{O}}$	output current		-	10	mA
$T_{\text{stg}}$	storage temperature		-55	+150	°C
$T_{\text{amb}}$	ambient temperature		-40	+85	°C
$T_{\text{j}}$	junction temperature		-	150	°C

[1] The supply voltages  $V_{\text{CCA}}$ ,  $V_{\text{CCD}}$  and  $V_{\text{CCO}}$  may have any value between -0.3 V and +7.0 V provided that the supply voltage differences  $\Delta V_{\text{CC}}$  are respected.

## 9. Thermal characteristics

**Table 5. Thermal characteristics**

Symbol	Parameter	Condition	Value	Unit
$R_{\text{th}(j-a)}$	thermal resistance from junction to ambient	in free air	75	K/W

## 10. Characteristics

**Table 6. Characteristics**

$V_{\text{CCA}} = V2$  to  $V44$ ,  $V3$  to  $V4$  and  $V41$  to  $V40 = 4.75$  V to  $5.25$  V;  $V_{\text{CCD}} = V37$  to  $V38$  and  $V15$  to  $V17 = 4.75$  V to  $5.25$  V;  $V_{\text{CCO}} = V33$  to  $V34 = 3.0$  V to  $3.6$  V;  $\text{AGND}$  and  $\text{DGND}$  shorted together;  $T_{\text{amb}} = -40$  °C to  $+85$  °C;

$V_{I(\text{IN})(p-p)} - V_{I(\text{INN})(p-p)} = 1.9$  V;  $V_{\text{VREF}} = V_{\text{CCA}3} - 1.75$  V;  $V_{I(\text{cm})} = V_{\text{CCA}3} - 1.6$  V; typical values measured at  $V_{\text{CCA}} = V_{\text{CCD}} = 5$  V and  $V_{\text{CCO}} = 3.3$  V,  $T_{\text{amb}} = 25$  °C and  $C_L = 10$  pF; unless otherwise specified.

Symbol	Parameter	Conditions	Test <sup>[1]</sup>	Min	Typ	Max	Unit
<b>Supplies</b>							
$V_{\text{CCA}}$	analog supply voltage			4.75	5.0	5.25	V
$V_{\text{CCD}}$	digital supply voltage			4.75	5.0	5.25	V
$V_{\text{CCO}}$	output supply voltage			3.0	3.3	3.6	V
$I_{\text{CCA}}$	analog supply current		I	-	78	87	mA
$I_{\text{CCD}}$	digital supply current		I	-	27	30	mA
$I_{\text{CCO}}$	output supply current	$f_{\text{clk}} = 20$ MHz; $f_i = 400$ kHz	I	-	3	4	mA
		$f_{\text{clk}} = 55$ MHz; $f_i = 20$ MHz	I	-	9.5	12	mA
$P_{\text{tot}}$	total power dissipation	$f_{\text{clk}} = 55$ MHz; $f_i = 20$ MHz		-	550	660	mW

### Inputs

CLK and CLKN (referenced to DGND)<sup>[2]</sup>

$V_{\text{IL}}$	LOW-level input voltage	PECL mode; $V_{\text{CCD}} = 5$ V	I	3.19	-	3.52	V
		TTL mode	C	0	-	0.8	V

**Table 6. Characteristics ...continued**

$V_{CCA} = V2$  to  $V44$ ,  $V3$  to  $V4$  and  $V41$  to  $V40 = 4.75$  V to  $5.25$  V;  $V_{CCD} = V37$  to  $V38$  and  $V15$  to  $V17 = 4.75$  V to  $5.25$  V;  $V_{CCO} = V33$  to  $V34 = 3.0$  V to  $3.6$  V; AGND and DGND shorted together;  $T_{amb} = -40$  °C to  $+85$  °C;  $V_{I(IN)(p-p)} - V_{I(INN)(p-p)} = 1.9$  V;  $V_{VREF} = V_{CCA3} - 1.75$  V;  $V_{I(cm)} = V_{CCA3} - 1.6$  V; typical values measured at  $V_{CCA} = V_{CCD} = 5$  V and  $V_{CCO} = 3.3$  V,  $T_{amb} = 25$  °C and  $C_L = 10$  pF; unless otherwise specified.

Symbol	Parameter	Conditions	Test <sup>[1]</sup>	Min	Typ	Max	Unit

[1] D = guaranteed by design; C = guaranteed by characterization; I = 100 % industrially tested.

[2] The circuit has two clock inputs: CLK and CLKN. There are 5 modes of operation:

- PECL mode 1: (DC level vary 1 : 1 with  $V_{CCD}$ ) CLK and CLKN inputs are at differential PECL levels.
- PECL mode 2: (DC level vary 1 : 1 with  $V_{CCD}$ ) CLK input is at PECL level and sampling is taken on the falling edge of the clock input signal. A DC level of 3.65 V has to be applied on CLKN decoupled to GND via a 100 nF capacitor.
- PECL mode 3: (DC level vary 1 : 1 with  $V_{CCD}$ ) CLKN input is at PECL level and sampling is taken on the rising edge of the clock input signal. A DC level of 3.65 V has to be applied on CLK decoupled to GND via a 100 nF capacitor.
- Differential AC driving mode 4: When driving the CLK input directly and with any AC signal of minimum 1 V (p-p) and with a DC level of 2.5 V, the sampling takes place at the falling edge of the clock signal. When driving the CLKN input with the same signal, sampling takes place at the rising edge of the clock signal. It is recommended to decouple the CLKN or CLK input to DGND via a 100 nF capacitor.
- TTL mode 1: CLK input is at TTL level and sampling is taken on the falling edge of the clock input signal. In that case CLKN pin has to be connected to the ground.

[3] The ADC input range can be adjusted with an external reference connected to VREF pin. This voltage has to be referenced to  $V_{CCA}$ ; see Figure 12.

[4] The -3 dB analog bandwidth is determined by the 3 dB reduction in the reconstructed output, the input being a full-scale sine wave.

[5] Total Harmonic Distortion (THD) is obtained with the addition of the first five harmonics:

$$THD = 20 \log \frac{\sqrt{(\alpha_{2H})^2 + (\alpha_{3H})^2 + (\alpha_{4H})^2 + (\alpha)^2 + (\alpha_{6H})^2}}{(a_{1H})^2}$$

where  $\alpha_{1H}$  is the fundamental harmonic referenced at 0 dB for a full-scale sine wave input; see Figure 6.

[6] Signal-to-noise ratio (S/N) takes into account all harmonics above five and noise up to Nyquist frequency; see Figure 8.

[7] Effective number of bits are obtained via a Fast Fourier Transform (FFT). The calculation takes into account all harmonics and noise up to half of the clock frequency (Nyquist frequency). Conversion to Signal-to\_Noise\_Distortion ratio (SINAD) is given by  $SINAD = ENOB \times 6.02 + 1.76$  dB; see Figure 5.

[8] Intermodulation measured relative to either tone with analog input frequencies of 20 MHz and 20.1 MHz. The two input signals have the same amplitude and the total amplitude of both signals provides full-scale to the converter (-6 dB below full scale for each input signal). IMD3 is the ratio of the RMS value of either input tone to the RMS value of the worst case third order intermodulation product.

[9] Output data acquisition: the output data is available after the maximum delay of  $t_{d(o)}$ ; see Figure 3.

## 11. Additional information relating to Table 6

**Table 7. Output coding with differential inputs (typical values to AGND);**  
 $V_{i(IN)(p-p)} - V_{i(INN)(p-p)} = 1.9\text{ V}$ ,  $V_{VREF} = V_{CCA3} - 1.75\text{ V}$

### 12.3 Alternative parts

The following alternative parts are also available:

Table 10. Alternative parts

Type number	Description		Sampling frequency
ADC1206S040	Single 12 bits ADC	[1]	40 MHz
ADC1206S055	Single 12 bits ADC	[1]	55 MHz
ADC1206S070	Single 12 bits ADC	[1]	70 MHz

[1] Pin to pin compatible

### 12.4 Recommended companion chip

The recommended companion chip is the TDA9901 wideband differential digital controlled variable gain amplifier.

## 13. Support information

### 13.1 Definitions

#### 13.1.1 Non-linearities

##### 13.1.1.1 Integral Non-Linearity (INL)

It is defined as the deviation of the transfer function from a best fit straight line (linear regression computation). The INL of the code  $i$  is obtained from the equation:

$$INL(i) = \frac{V_I(i) - V_I(ideal)}{S} \tag{1}$$

where  $i = 0 \cdot (2^n - 1)$  and

$S$  = slope of the ideal straight line = code width;  $i$  = code value.

##### 13.1.1.2 Differential Non-Linearity (DNL)

It is the deviation in code width from the value of 1 LSB.

$$DNL(i) = \frac{V_I(i+1) - V_I(i)}{S} - 1 \tag{2}$$

where  $i = 0 \cdot (2^n - 2)$

#### 13.1.2 Dynamic parameters (single tone)

Figure 26 shows the spectrum of a full-scale input sine wave with frequency  $f_t$ , conforming to coherent sampling ( $f_t / f_s = M / N$ , where  $M$  is the number of cycles and  $N$  is number of samples,  $M$  and  $N$  being relatively prime), and digitized by the ADC under test.

Fig 26. Spectrum of full-scale input sine wave with frequency  $f_t$

**Remark:** In the following equations,  $P_{\text{noise}}$  is the power of the terms which include the effects of random noise, non-linearities, sampling time errors, and 'quantization noise'.

### 13.1.2.1 Signal-to-Noise And Distortion (SINAD)

The ratio of the output signal power to the noise and distortion power for a given sample rate and input frequency, excluding the DC component:

$$SINAD [dB] = 10 \log \left[ \frac{P_{\text{signal}}}{P_{\text{noise} + \text{distortion}}} \right] \quad (3)$$

### 13.1.2.2 Effective Number Of Bits (ENOB)

It is derived from SINAD and gives the theoretical resolution an ideal ADC would require to obtain the same SINAD measured on the real ADC. A good approximation gives:

$$ENOB = (SINAD [dB] - (1.76)) / (6.02)$$

### 13.1.2.3 Total Harmonic Distortion (THD)

The ratio of the power of the harmonics to the power of the fundamental. For k-1 harmonics the THD is:

$$THD [dB] = 10 \log \left[ \frac{P_{\text{harmonics}}}{P_{\text{signal}}} \right] \quad (4)$$

$$\text{where } P_{\text{harmonics}} = \alpha|_2^2 + \alpha|_3^2 + \alpha|_k^2 \text{ and } P_{\text{signal}} = \alpha|_1^2$$

The value of k is usually 6 (i.e. calculation of THD is done on the first 5 harmonics).

### 13.1.2.4 Signal-to-Noise ratio (S/N)

The ratio of the output signal power to the noise power, excluding the harmonics and the DC component.

$$S/N [dB] = 10 \log \left[ \frac{P_{\text{signal}}}{P_{\text{noise}}} \right] \quad (5)$$

### 13.1.2.5 Spurious Free Dynamic Range (SFDR)

The number SFDR specifies available signal range as the spectral distance between the amplitude of the fundamental and the amplitude of the largest spurious (harmonic and non-harmonic), excluding DC component.

$$SFDR [dB] = 20 \log \frac{\alpha_1}{\max(s)} \quad (6)$$

13.1.3 Intermodulation distortion

13.1.3.1 Spectral analysis (dual-tone)

Fig 27. Spectral analysis (dual-tone)

From a dual-tone input sinusoid ( $f_{t1}$  and  $f_{t2}$ , these frequencies being chosen according to the coherence criterion), the intermodulation distortion products IMD2 and IMD3 (respectively, 2nd and 3rd-order components) are defined, as follows.

13.1.3.2 IMD2 (IMD3)

The ratio of the RMS value of either tone to the RMS value of the worst second (third) order intermodulation product.

The total IMD is given by:

$$IMD [dB] = 10 \log \left[ \frac{P_{intermod}}{P_{signal}} \right]$$

where,

$$P_{intermod} = a_{im}^2(f_{t1} - f_{t2}) - a_{im}^2(f_{t1} + f_{t2}) + a_{im}^2(f_{t1} - 2f_{t2}) + a_{im}^2(f_{t1} + 2f_{t2}) + a_{im}^2(2f_{t1} - f_{t2}) + a_{im}^2(2f_{t1} + f_{t2})$$

$$P_{signal} = a^2(f_{t1}) + a^2(f_{t2}) \quad \text{and}$$

$a_{im}^2(f_t)$  is the power in the intermodulation component at frequency  $f_t$ .

13.1.4 Noise Power Ratio (NPR)

When using a notch-filtered broadband white-noise generator as the input to the ADC under test, the NPR is defined as the ratio of the average out-of-notch to the in-notch power spectral density magnitudes for the FFT spectrum of the ADC output sample set.
