1 Introduction

V2DIP1-64 module is designed to allow rapid development of designs using the VNC2-64Q IC. The V2DIP1-64 is supplied as a PCB designed to fit into a 60 pin 0.8" wide 0.1" pitch DIP socket.The module provides access to the UART, parallel FIFO, and SPI interface pins of the VNC2-64Q device, via its IO bus pins. One USB port is accessed via a type A USB connector.

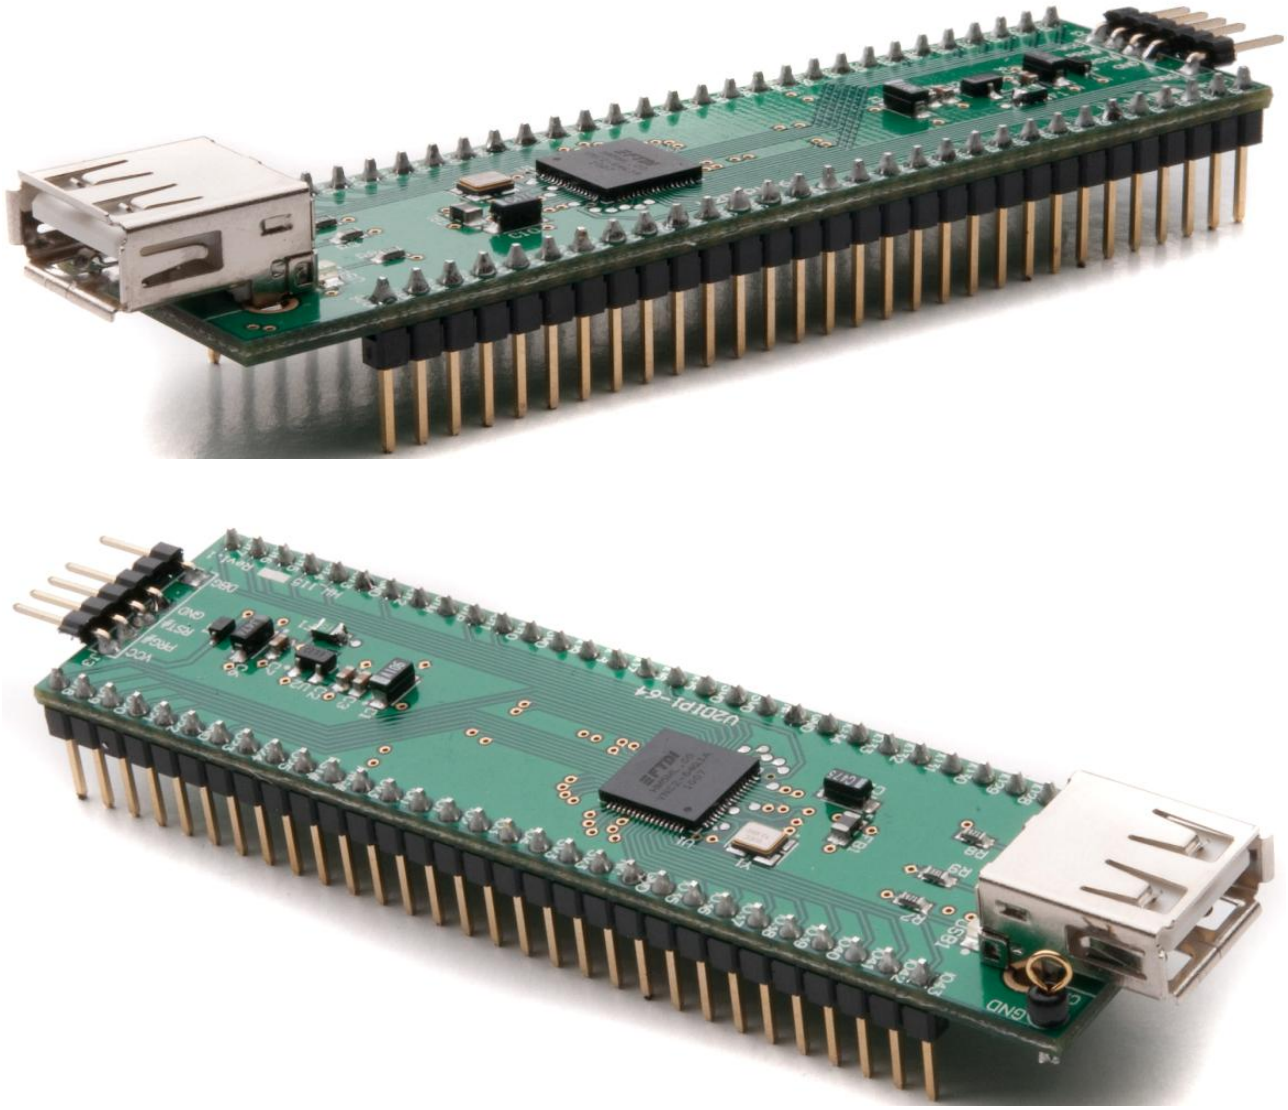

Figure 1.1 - V2DIP1 64

The VNC2 is the second of FTDI's Vinculum family of Embedded dual USB host controller devices. The VNC2 device provides USB Host interfacing capability for a variety of different USB device classes including support for BOMS (bulk only mass storage), Printer, HID (human interface devices). For mass storage devices such as USB Flash drives, VNC2 also transparently handles the FAT file structure.

Communication with non USB devices such as a low cost microcontroller is accomplished via either UART, SPI or parallel FIFO interfaces. The VNC2 provides a new cost effective solution for providing USB Host capability into products that previously did not have the hardware resources available.

The VNC2 supports the capability to enable customers to develop custom firmware using the Vinculum II development software tool suite. The development tools support compiler, linker and debugger tools complete within an integrated development environment (IDE).

The Vinculum-II VNC2 family of devices are available in Pb-free (RoHS compliant) 32-lead LQFP, 32-lead QFN, 48-lead LQFP, 48-lead QFN, 64-Lead lQFP and 64-lead QFN packages

Table of Contents

2 Features

The V2DIP1-64 incorporates the following features:

- Uses FTDI's VNC2-64Q embedded USB host controller IC device
- USB single 'A' type USB to interface with USB peripheral devices.
- Second USB interface port available via module header pins if required.
- UART, parallel FIFO and SPI interfaces can be programmed to a choice of available I/O pins
- Single 5V supply input from DIL connectors or 5V supplied via USB VBUS slave interface or debugger module.
- Auxiliary 3.3 V / 200 mA power output to external logic
- All VNC2 signals available on 0.8" wide, 0.1" pitch DIL male connectors.
- Power and traffic indicator LED's
- V2DIP1-64 is a Pb-free, RoHS complaint development module
- Debugger interface pin available on DIL pins or via 6 way male header which interfaces to separate debugger module.
- Firmware upgrades via UART or debugger interface.
- FOC software development suite of tools to create customised firmware includes a Compiler, Linker,Debugger and Assembler all wrapped up in an easy to use Integrated Design Environment GUI.

3.4 UART Interface

When the data and control buses are configured in UART mode, the interface implements a standard asynchronous serial UART port with flow control. The UART can support baud rates from 300baud to 3Mbaud. Further details on the UART interface are available on the the Vinculum-II datasheet please refer to:- FTDI website

3.4.1 Signal Description – UART Interface

The UART signals can be programmed to a choice of available I/O pins. Table 3.3 explains the available pins for each of the UART signals.

Available Pins	*Name*	*Type*	*Description*
J2-14, J1-17, J1-24, J1-29, J2-28, J2-23, J1-3, J1-7, J2-8, J2-4	uart_txd	Output	Transmit asynchronous data output

J2-16, J1-15, J1-20, J1-27, J2-30, J2-26, J1-1, J1-5, J1-9, J2-6, J2-2	fifo_rd#	Input	Enables the current FIFO data byte on D0...D7 when low. Fetches the next FIFO data byte (if available) from the receive FIFO buffer when fifo_rd# goes from high to low
J2-15, JI-16, J1-21, J1-28, J2-29, J2-24, J1-2, J1-6, J2-9, J2-5, J2-1	fifo_wr#	Input	Writes the data byte on the D0...D7 pins into the transmit FIFO buffer when fifo_wr# goes from high to low.

Table 3.6 - Data and Control Bus Signal Mode Options – Parallel FIFO Interface

3.6.2 Timing Diagram – Asynchronous FIFO Mode Read and Write Cycle

When in Asynchronous FIFO interface mode, the timing of a read and write operation on the FIFO interface is shown in Figure 3.3 **and** Table 3.7

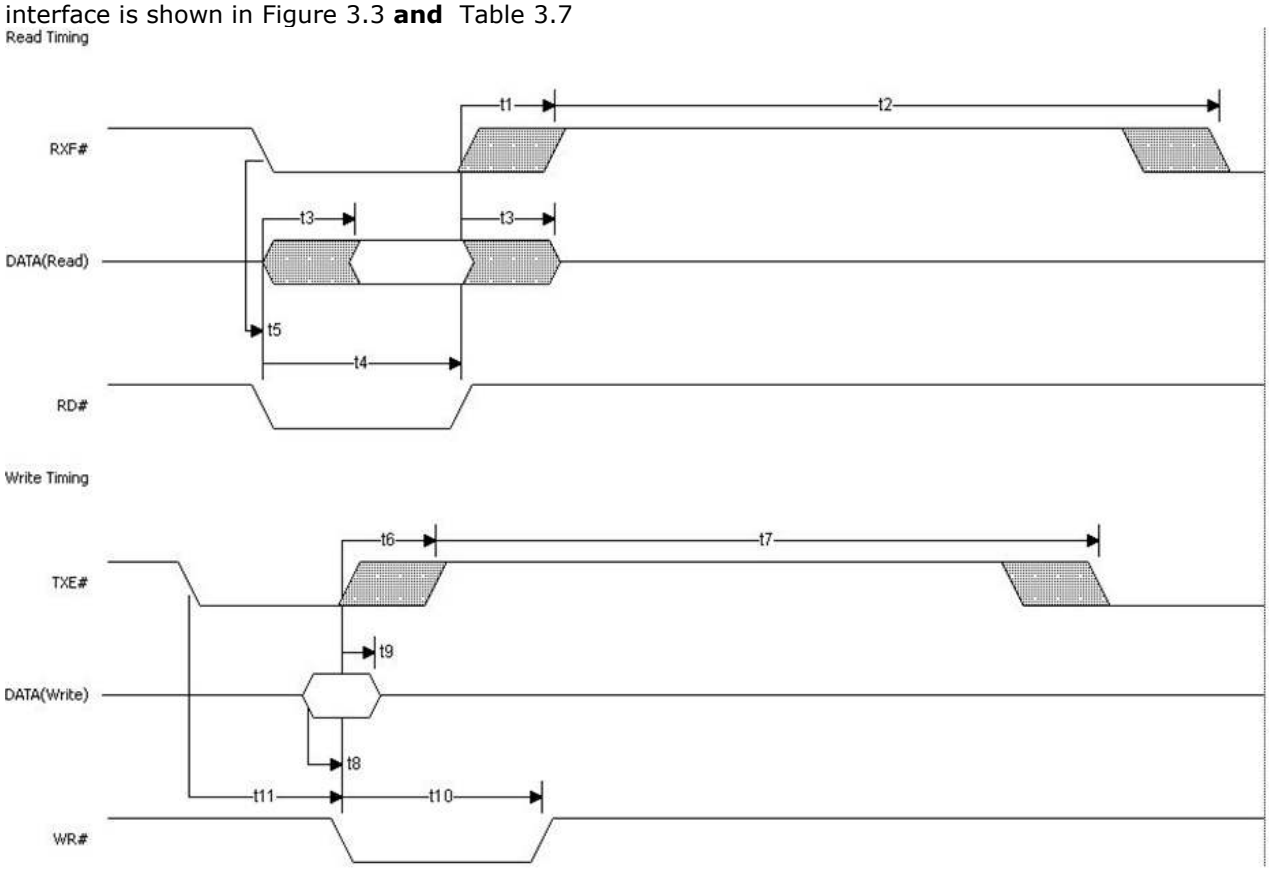

Figure 3.3 – Asynchronous FIFO Mode Read and Write Cycle.

Time	Description	Min	Max	Unit
t1	RD# inactive to RXF#	1	14	ns
t2	RXF# inactive after RD# cycle	100	-	ns
t3	RD# to Data	1	14	ns
t4	RD# active pulse width	30	-	ns
t5	RD# active after RXF#	0	-	ns
t6	WR# active to TXE# inactive	1	14	ns
t7	TXE# inactive after WR# cycle	100	-	ns
t8	DATA to TXE# active setup time	5	-	ns
t9	DATA hold time after WR# inactive	5	-	ns
t10	WR# active pulse width	30	-	ns
t11	WR# active after TXE#	0	-	ns

Table 3.7 - Asynchronous FIFO Mode Read Cycle Timing

In asynchronous mode an external device can control data transfer driving FIFO_WR# and FIFO_RD# inputs. In contrast to synchronous mode, in asynchronous mode the 245 FIFO module generates the output enable EN# signal. EN# signal is effectively the read signal RD#.

Current byte is available to be read when FIFO_RD# goes low. When FIFO_RD# goes high, FIFO_RXF# output will also go high. It will only become low again when there is another byte to read.

When FIFO_WR# goes low FIFO_TXE# flag will always go high. FIFO_TXE# goes low again only when there is still space for data to be written in to the module.

3.7 Parallel FIFO Interface-Synchronous Mode

The Parallel FIFO Synchronous mode has an eight bit data bus, individual read and write strobes, two hardware flow control signals, an output enable and a clock out.

The synchronous FIFO mode uses the parallel FIFO interface signals detailed in **Table 3.6** and additional two signals detailed **Table 3.8**.

3.7.1 Timing Diagram – Synchronous FIFO Mode Read and Write Cycle

When in Synchronous FIFO interface mode, the timing of a read and write operation on the FIFO interface are shown in **Figure 3.4** and **Table 3.9**

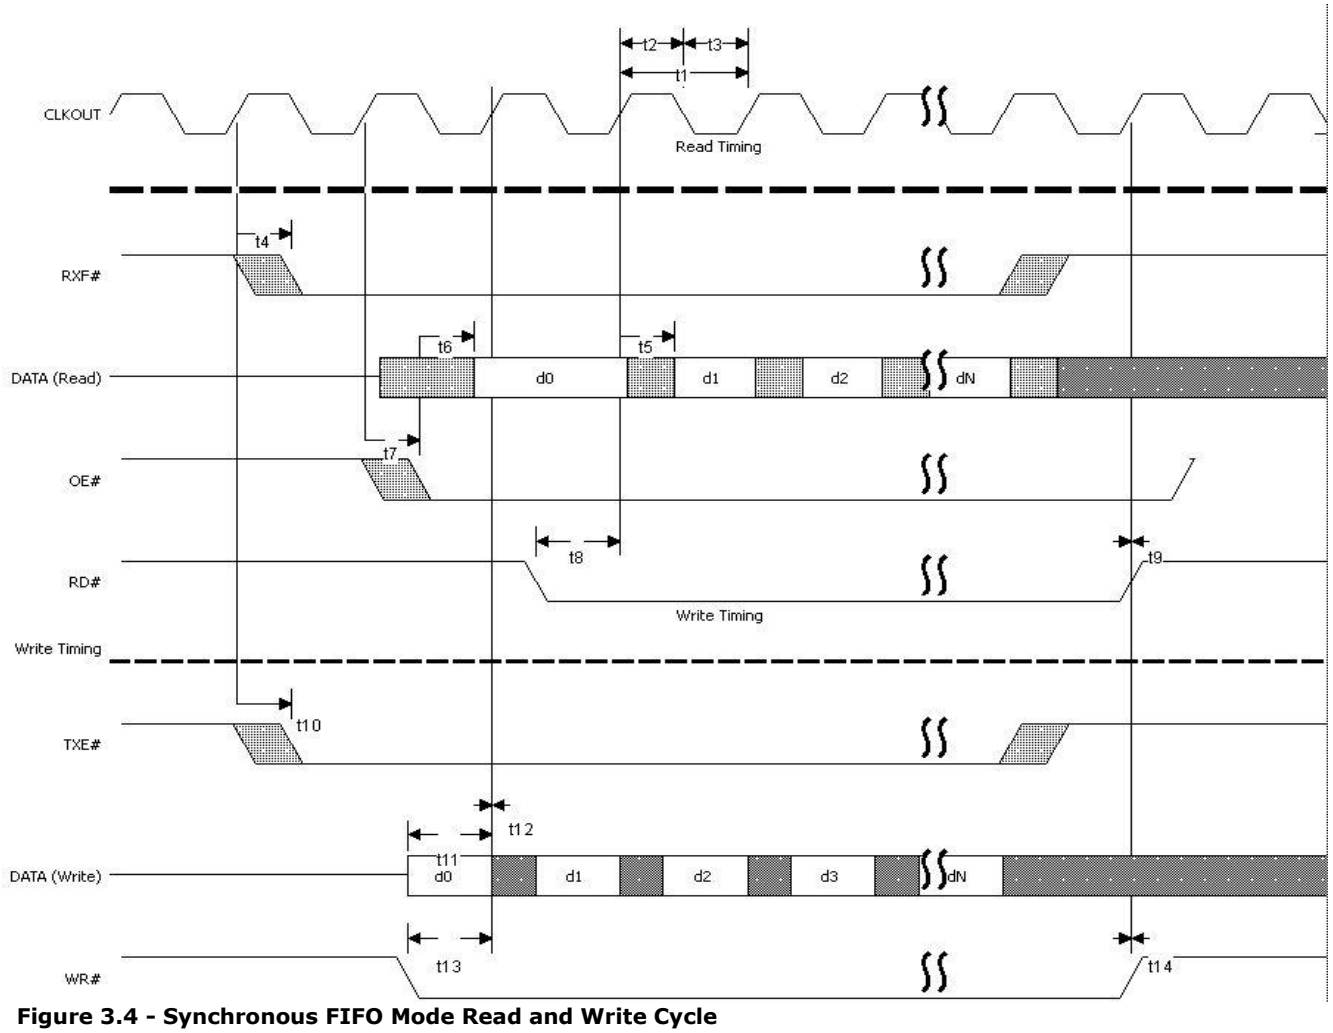

Figure 3.4 - Synchronous FIFO Mode Read and Write Cycle

Time	Description	Min	Typical	Max	Uni
t1	CLKOUT period	-	20.83	-	ns
t2	CLKOUT high period	9.38	10.42	11.46	ns
t3	CLKOUT low period	9.38	10.42	11.46	ns
t4	CLKOUT to RXF#	1	-	7.83	ns
t5	CLKOUT to read DATA valid	1	-	7.83	ns
t6	OE# to read DATA valid	1	-	7.83	ns
t7	CLKOUT to OE#	1	-	7.83	ns
t8	RD# setup time	12	-	-	ns
t9	RD# hold time	0	-	-	ns
t10	CLKOUT TO TXE#	1	-	-	ns
t11	Write DATA setup time	12	-	-	ns
t12	Write DATA hold time	0	-	-	ns
t13	WR# setup time	12	-	-	ns
t14	WR# hold time	0	-	-	ns

Table 3.9 - Synchronous FIFO Mode Read and Write Cycle Timing

In synchronous mode data can be transmitted to and from the FIFO module on each clock edge. An external device synchronises to the CLKOUT output and it also has access to the output enable OE# input to control data flow. An external device should drive output enable OE# low before pulling RD# line down.

When bursts of data are to be read from the module RD# should be kept low. RXF# remains low when there is still data to be read. Similarly when bursts of data are to be written to the module WR# should be kept low. TXE# remains low when there is still space available for the data to be written

3.8 Debugger Interface

The purpose of the debugger interface is to provide access to the VNC2 silicon/firmware debugger. The debug interface can be accessed via the appropriate pin on the DIL connector or more easily, it can be accessed by connecting a debug module to the J3 connector. This debug module will give access to the debugger through a USB connection to a PC via the Integrated Development Environment (IDE). The IDE is a graphical interface to the VNC2 software development tool-chain and gives the following debug capabilities through the debugger interface:

- Flash Erase, Write and Program.
- Application debug - application code can have breakpoints, be single stepped and can be halted.
- Detailed internal debug - memory and register read/write access.

The Debugger Interface, and how to use it, is further described in the following applications Note Vinculum-II Debug Interface Description

3.8.1 ignal Description - Debugger Interface

Table 3.10 shows the signals and pins description for the Debugger Interface pin header J3

Pin No.	*Name*	*Name On PCB*	*Type*	*Description*
J3-1	IO0	DBG	I/O	Debugger Interface
J3-2	-	[Key]	-	Not connected. Used to make sure that the debug module is connected correctly.
J3-3	GND	GND	PWR	Module ground supply pin
J3-4	RESET#	RST#	Input	Can be used by an external device to reset the VNCL2. This pin is also used in combination with PROG# and the UART interface to program firmware into the VNC2.
J3-5	PROG#	PRG#	Input	This pin is used in combination with the RESET# pin and the UART interface to program firmware into the VNC2.
J3-6	5V0	VCC	PWR Input	5.0V module supply pin. This pin can be used to provide the 5.0V input to the V2DIP1-64 from the debugger interface when the V2DIP1-64 is not powered from the USB connector (VBUs) or the DIL connector pins J1-12, J1-13 and J1-19 and J3-6.

4 Firmware

4.1 Firmware Support

The VNC2 on the V2DIP1-64 can be programmed with the customers own firmware created using the Vinculum II firmware development tool chain or with various pre-compiled firmware profiles to allow a designer to easily change the functionality of the chip. Please refer to:- FTDI website for full details on available pre-compiled firmware

4.2 Available Firmware

V2DAP firmware is currently available: USB Host for single Flash Disk and general purpose USB peripherals. Selectable UART, FIFO or SPI interface command monitor. please refer to:- FTDI website for full details.

4.3 Firmware Upgrades

Refer to the debugger interface section which can be used to update the firmware.

5 External circuit Configuration

5.1 Adding a second USB Port

The external circuit configuration for adding second USB host port, with the USB activity LED, is shown below in **Figure 5.1**
