NCP4680

150 mA, Low Noise Low Dropout Regulator

The NCP4680 is a CMOS linear voltage regulator with 150 mA output current capability. The device is available in a tiny 0.8x0.8 mm XDFN, and has high output voltage accuracy, low supply current and high ripple rejection. The NCP4680 is easy to use and includes output current fold-back protection. A Chip Enable function is included to save power by lowering supply current. The line and load transient responses are very good, making this regulator ideal for use as a power supply for communication equipment.

Features

- Operating Input Voltage Range: 1.40 V to 5.25 V
- Output Voltage Range: 0.8 V to 3.6 V (available in 0.1 V steps)
- Output Voltage Accuracy: $\pm 1.0\%$
- Supply Current: 50 μA typical
- Dropout Voltage: 0.25 V ($I_{\text{OUT}} = 150 \text{ mA}$, $V_{\text{OUT}} = 2.5 \text{ V}$)
- High PSRR: 75 dB ($f = 1 \text{ kHz}$, $V_{\text{OUT}} = 2.5 \text{ V}$)
- Line Regulation: 0.02%/V Typ.
- Stable with Ceramic Capacitors: 0.1 μF or more
- Current Fold Back Protection
- Available in XDFN4 0.8 x 0.8 mm, SC-70, SOT23 Packages
- These are Pb-Free Devices

Typical Applications

- Battery-powered Equipment
- Networking and Communication Equipment
- Cameras, DVRs, STB and Camcorders
- Home Appliances

PIN FUNCTION DESCRIPTION

Pin No. XDFN4*	Pin No. SC-70	Pin No. SOT23	Pin Name	Description
1	4	5	V _{OUT}	Output pin
2	3	2	GND	Ground
3	1	3	CE	Chip enable pin (Active "H")
4	5	1	V _{IN}	Input pin
-	2	4	NC	No connection

*Tab is GND level. (They are connected to the reverse side of this IC.
The tab is better to be connected to the GND, but leaving it open is also acceptable.

ABSOLUTE MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Input Voltage (Note 1)	V _{IN}	6.0	V
Output Voltage	V _{OUT}	-0.3 to V _{IN} + 0.3	V
Chip Enable Input	V _{CE}	6.0	V
Output Current	I _{OUT}	180	mA
Power Dissipation XDFN0808	P _D	286	mW
Power Dissipation SC-70		380	
Power Dissipation SOT23		420	
Junction Temperature	T _J	-40 to 150	°C
Storage Temperature	T _{STG}	-55 to 125	°C
ESD Capability, Human Body Model (Note 2)	ESD _{HBM}	2000	V
ESD Capability, Machine Model (Note 2)	ESD _{MM}	200	V

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

1. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.
2. This device series incorporates ESD protection and is tested by the following methods:
ESD Human Body Model tested per AEC-Q100-002 (EIA/JESD22-A114)
ESD Machine Model tested per AEC-Q100-003 (EIA/JESD22-A115)
Latch-up Current Maximum Rating tested per JEDEC standard: JESD78.

APPLICATION INFORMATION

A typical application circuit for NCP4680 series is shown in Figure 55.

Figure 55. Typical Application Schematic

Input Decoupling Capacitor (C1)

A 0.1 μF ceramic input decoupling capacitor should be connected as close as possible to the input and ground pin of the NCP4680. Higher values and lower ESR improves line transient response.

Output Decoupling Capacitor (C2)

A 0.1 μF ceramic output decoupling capacitor is enough to achieve stable operation of the IC. If a tantalum capacitor is used, and its ESR is high, loop oscillation may result. The capacitors should be connected as close as possible to the output and ground pins. Larger values and lower ESR improves dynamic parameters.

Current Limit

The NCP4680 includes fold-back type current limit protection. Its typical characteristic for 0.8 V version is shown in Figure 3. The advantage of this protection is that power loss at the regulator is minimized at over current or short circuit conditions. When the over current or short circuit event disappears, the regulator reverts from fold back to regulation. This kind of current limit may cause issues at start-up for voltage versions below 1.8 V and some load types: for these lower voltage options it is recommended to

start-up into at least double the minimum equivalent load. The minimum equivalent resistance can be computed by formula 1:

$$R_{EQMIN} = \frac{V_{OUT(NOM)}}{I_{OUTMAX}} \quad (\text{eq. 1})$$

This leads us to the result that the minimum equivalent start up resistance for $V_{OUT(NOM)} < 1.8 \text{ V}$ is:

$$R_{SUMIN} = 2 \cdot R_{EQMIN} \quad (\text{eq. 2})$$

Enable Operation

The enable pin CE may be used for turning the regulator on and off. The IC is switched on when a high level voltage is applied to the CE pin. The enable pin has an internal pull down current source. If the enable function is not needed connect CE pin to VIN.

Output Discharger

The D version includes a transistor between VOUT and GND that is used for faster discharging of the output capacitor. This function is activated when the IC goes into disable mode.

Thermal

As power across the IC increase, it might become necessary to provide some thermal relief. The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material, and also the ambient temperature affect the rate of temperature increase for the part. When the device has good thermal conductivity through the PCB the junction temperature will be relatively low in high power dissipation applications.

PCB layout

Make the VIN and GND line as large as practical. If their impedance is high, noise pickup or unstable operation may result. Connect capacitors C1 and C2 as close as possible to the IC, and make wiring as short as possible.
