MSP430 SoC With RF Core

FEATURES

- True System-on-Chip (SoC) for Low-Power Wireless Communication Applications
- Wide Supply Voltage Range: 3.6 V Down to 1.8 V
- Ultralow Power Consumption:
 - CPU Active Mode (AM): 160 μ A/MHz
 - Standby Mode (LPM3 RTC Mode): 2.0 μ A
 - Off Mode (LPM4 RAM Retention): 1.0 μ A
 - RTC Only Mode (LPM3.5): 1.0 μ A
 - Shutdown Mode (LPM4.5): 0.3 μ A
 - Radio in RX: 15 mA, 250 kbps, 915 MHz
- MSP430™ System and Peripherals
 - 16-Bit RISC Architecture, Extended Memory, up to 20-MHz System Clock
 - Wake-Up From Standby Mode in Less Than 6 μ s
 - Flexible Power Management System With SVS and Brownout
 - Unified Clock System With FLL
 - 16-Bit Timer TA0, Timer_A With Five Capture/Compare Registers
 - 16-Bit Timer TA1, Timer_A With Three Capture/Compare Registers
 - Hardware Real-Time Clock
 - Two Universal Serial Communication Interfaces
 - USCI_A0 Supports UART, IrDA, SPI
 - USCI_B0 Supports I²C™, SPI
 - 10-Bit A/D Converter With Internal Reference, Sample-and-Hold, and Autoscan Features (Only CC430F614x and CC430F514x)
 - Comparator
 - Integrated LCD Driver With Contrast Control for up to 96 Segments (Only CC430F614x)
 - 128-Bit AES Security Encryption and Decryption Coprocessor
 - 32-Bit Hardware Multiplier
 - Three-Channel Internal DMA
- Serial Onboard Programming, No External Programming Voltage Needed
- Embedded Emulation Module (EEM)
- High-Performance Sub-1-GHz RF Transceiver Core
 - Same as in CC1101
 - Wide Supply Voltage Range: 2.0 V to 3.6 V
 - Frequency Bands: 300 MHz to 348 MHz, 389 MHz to 464 MHz, and 779 MHz to 928 MHz
 - Programmable Data Rate From 0.6 kBaud to 500 kBaud
 - High Sensitivity (-117 dBm at 0.6 kBaud, -111 dBm at 1.2 kBaud, 315 MHz, 1% Packet Error Rate)
 - Excellent Receiver Selectivity and Blocking Performance
 - Programmable Output Power Up to +12 dBm for All Supported Frequencies
 - 2-FSK, 2-GFSK, and MSK Supported as well as OOK and Flexible ASK Shaping
 - Flexible Support for Packet-Oriented Systems: On-Chip Support for Sync Word Detection, Address Check, Flexible Packet Length, and Automatic CRC Handling
 - Support for Automatic Clear Channel Assessment (CCA) Before Transmitting (for Listen-Before-Talk Systems)
 - Digital RSSI Output
 - Suited for Systems Targeting Compliance With EN 300 220 (Europe) and FCC CFR Part 15 (US)
 - Suited for Systems Targeting Compliance With Wireless M-Bus Standard EN 13757-4:2005
 - Support for Asynchronous and Synchronous Serial Receive/Transmit Mode for Backward Compatibility With Existing Radio Communication Protocols
- Family Members Summarized in [Table 1](#)
- For Complete Module Descriptions, See the [CC430 Family User's Guide \(SLAU259\)](#)

DESCRIPTION

The Texas Instruments CC430 family of ultralow-power microcontroller system-on-chip with integrated RF transceiver cores consists of several devices featuring different sets of peripherals targeted for a wide range of applications. The architecture, combined with seven low-power modes (including LPM3.5 and LMP4.5), is optimized to achieve extended battery life in portable measurement applications. The device features the powerful MSP430™ 16-bit RISC CPU, 16-bit registers, and constant generators that contribute to maximum code efficiency.

The CC430 family provides a tight integration between the microcontroller core, its peripherals, software, and the RF transceiver, making these true system-on-chip solutions easy to use as well as improving performance.

The CC430F614x series are microcontroller system-on-chip configurations combining the excellent performance of the state-of-the-art CC1101 sub-1-GHz RF transceiver with the MSP430 CPUXV2, up to 32 kB of in-system programmable flash memory, up to 4 kB of RAM, two 16-bit timers, a high-performance 10-bit A/D converter with eight external inputs plus internal temperature and battery sensors, comparator, universal serial communication interfaces (USCIs), 128-bit AES security accelerator, hardware multiplier, DMA, real-time clock module with alarm capabilities, LCD driver, and up to 44 I/O pins.

The CC430F514x and CC430F512x series are microcontroller system-on-chip configurations combining the excellent performance of the state-of-the-art CC1101 sub-1-GHz RF transceiver with the MSP430 CPUXV2, up to 32 kB of in-system programmable flash memory, up to 4 kB of RAM, two 16-bit timers, a high performance 10-bit A/D converter with six external inputs plus internal temperature and battery sensors on CC430F514x devices, comparator, universal serial communication interfaces (USCI), 128-bit AES security accelerator, hardware multiplier, DMA, real-time clock module with alarm capabilities, and up to 30 I/O pins.

Typical applications for these devices include wireless analog and digital sensor systems, heat cost allocators, thermostats, metering (AMR, AMI), smart grid wireless networks etc.

Family members available are summarized in [Table 1](#).

For complete module descriptions, see the *CC430 Family User's Guide* ([SLAU259](#)).

(1) Each number in the sequence represents an instantiation of Timer_A with its associated number of capture compare registers and PWM output generators available. For example, a number sequence of 5, 3 would represent two instantiations of Timer_A, the first instantiation having 5 and the second instantiation having 3 capture compare registers and PWM output generators, respectively.

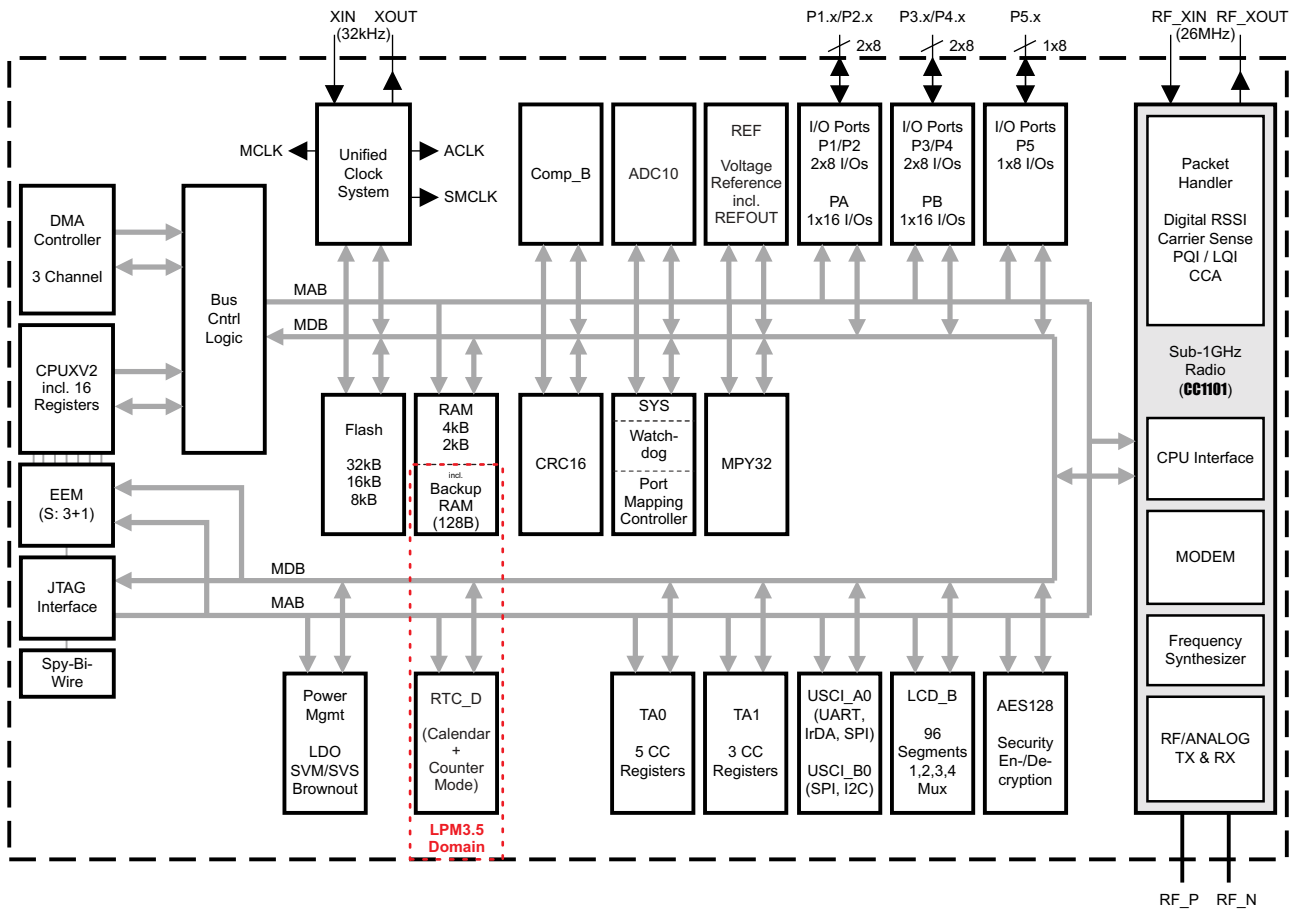

(2) n/a = not available

SHORT-FORM DESCRIPTION

Sub-1-GHz Radio

The implemented sub-1-GHz radio module is based on the industry-leading CC1101, requiring very few external components. Figure 1 shows a high-level block diagram of the implemented radio.

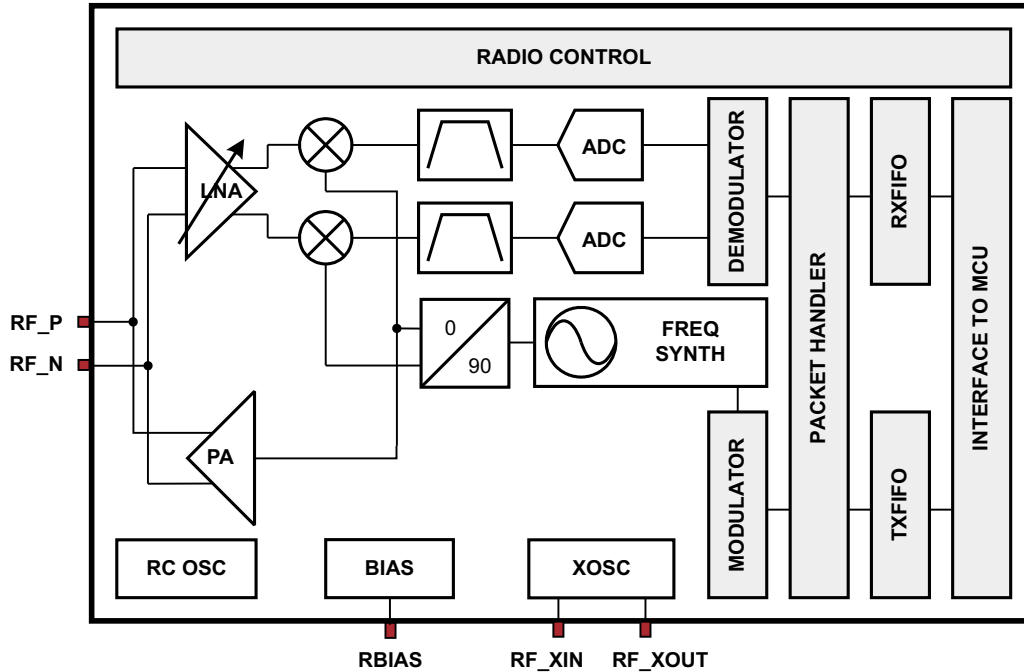

Figure 1. Sub-1 GHz Radio Block Diagram

The radio features a low-IF receiver. The received RF signal is amplified by a low-noise amplifier (LNA) and down-converted in quadrature to the intermediate frequency (IF). At IF, the I/Q signals are digitized. Automatic gain control (AGC), fine channel filtering, demodulation bit and packet synchronization are performed digitally.

The transmitter part is based on direct synthesis of the RF frequency. The frequency synthesizer includes a completely on-chip LC VCO and a 90° phase shifter for generating the I and Q LO signals to the down-conversion mixers in receive mode.

The 26-MHz crystal oscillator generates the reference frequency for the synthesizer, as well as clocks for the ADC and the digital part.

A memory mapped register interface is used for data access, configuration and status request by the CPU.

The digital baseband includes support for channel configuration, packet handling, and data buffering.

For complete module descriptions, see the *CC430 Family User's Guide* (SLAU259).

CPU

The MSP430 CPU has a 16-bit RISC architecture that is highly transparent to the application. All operations, other than program-flow instructions, are performed as register operations in conjunction with seven addressing modes for source operand and four addressing modes for destination operand.

The CPU is integrated with 16 registers that provide reduced instruction execution time. The register-to-register operation execution time is one cycle of the CPU clock.

Four of the registers, R0 to R3, are dedicated as program counter, stack pointer, status register, and constant generator, respectively. The remaining registers are general-purpose registers.

Peripherals are connected to the CPU using data, address, and control buses and can be handled with all instructions.

The instruction set consists of the original 51 instructions with three formats and seven address modes and additional instructions for the expanded address range. Each instruction can operate on word and byte data.

Operating Modes

The CC430 has one active mode and seven software selectable low-power modes of operation. An interrupt event can wake up the device from any of the low-power modes, service the request, and restore back to the low-power mode on return from the interrupt program.

The following eight operating modes can be configured by software:

- Active mode (AM)
 - All clocks are active
- Low-power mode 0 (LPM0)
 - CPU is disabled
 - ACLK and SMCLK remain active, MCLK is disabled
 - FLL loop control remains active
- Low-power mode 1 (LPM1)
 - CPU is disabled
 - FLL loop control is disabled
 - ACLK and SMCLK remain active, MCLK is disabled
- Low-power mode 2 (LPM2)
 - CPU is disabled
 - MCLK and FLL loop control and DCOCLK are disabled
 - DCO's dc-generator remains enabled
 - ACLK remains active
- Low-power mode 3 (LPM3)
 - CPU is disabled
 - MCLK, FLL loop control, and DCOCLK are disabled
 - DCO's dc-generator is disabled
 - ACLK remains active
- Low-power mode 4 (LPM4)
 - CPU is disabled
 - ACLK is disabled
 - MCLK, FLL loop control, and DCOCLK are disabled
 - DCO's dc-generator is disabled
 - Crystal oscillator is stopped
 - Complete data retention
- Low-power mode 3.5 (LPM3.5)
 - Internal regulator disabled
 - No data retention except Backup RAM and RTC
 - RTC enabled and clocked by low-frequency crystal oscillator XT1
 - Wake up from $\overline{\text{RST}}/\text{NMI}$, RTC, P1, P2
- Low-power mode 4.5 (LPM4.5)
 - Internal regulator disabled
 - No data retention except Backup RAM
 - Wake up from $\overline{\text{RST}}/\text{NMI}$, P1, P2

Interrupt Vector Addresses

The interrupt vectors and the power-up start address are located in the address range 0FFFFh to 0FF80h. The vector contains the 16-bit address of the appropriate interrupt-handler instruction sequence.

(2) A reset is generated if the CPU tries to fetch instructions from within peripheral space.

(3) (Non)maskable: the individual interrupt enable bit can disable an interrupt event, but the general interrupt enable cannot disable it.

(4) Reserved interrupt vectors at addresses are not used in this device and can be used for regular program code if necessary. To maintain compatibility with other devices, it is recommended to reserve these locations.

Bootstrap Loader (BSL)

The BSL enables users to program the flash memory or RAM using various serial interfaces. Access to the device memory via the BSL is protected by a user-defined password. BSL entry requires a specific entry sequence on the RST/NMI/SBWDIO and TEST/SBWTCK pins. For a complete description of the features of the BSL and its implementation, see the *MSP430 Programming Via the Bootstrap Loader User's Guide* (SLAU319).

JTAG Operation

JTAG Standard Interface

The CC430 family supports the standard JTAG interface which requires four signals for sending and receiving data. The JTAG signals are shared with general-purpose I/O. The TEST/SBWTCK pin is used to enable the JTAG signals. In addition to these signals, the RST/NMI/SBWDIO is required to interface with MSP430 development tools and device programmers. The JTAG pin requirements are shown in Table 8. For further details on interfacing to development tools and device programmers, see the *MSP430 Hardware Tools User's Guide* (SLAU278). For a complete description of the features of the JTAG interface and its implementation, see *MSP430 Programming Via the JTAG Interface* (SLAU320).

Spy-Bi-Wire Interface

In addition to the standard JTAG interface, the CC430 family supports the two wire Spy-Bi-Wire interface. Spy-Bi-Wire can be used to interface with MSP430 development tools and device programmers. The Spy-Bi-Wire interface pin requirements are shown in Table 9. For further details on interfacing to development tools and device programmers, see the *MSP430 Hardware Tools User's Guide* (SLAU278). For a complete description of the features of the JTAG interface and its implementation, see *MSP430 Programming Via the JTAG Interface* (SLAU320).

Flash Memory

The flash memory can be programmed via the JTAG port, Spy-Bi-Wire (SBW), or in-system by the CPU. The CPU can perform single-byte, single-word, and long-word writes to the flash memory. Features of the flash memory include:

- Flash memory has n segments of main memory and four segments of information memory (Info A to Info D) of 128 bytes each. Each segment in main memory is 512 bytes in size.
- Segments 0 to n may be erased in one step, or each segment may be individually erased.
- Segments Info A to Info D can be erased individually, or as a group with the main memory segments. Segments Info A to Info D are also called *information memory*.
- Segment A can be locked separately.

RAM Memory

The RAM memory is made up of n sectors. Each sector can be completely powered down to save leakage, however all data is lost. Features of the RAM memory include:

- RAM memory has n sectors of 2k bytes each.
- Each sector 0 to n can be complete disabled; however, data retention is lost.
- Each sector 0 to n automatically enters low-power retention mode when possible.

Backup RAM

The backup RAM provides 128 bytes of memory that are retained even in LPM3.5 and LPM4.5 when the core is powered down.

Peripherals

Peripherals are connected to the CPU through data, address, and control buses and can be handled using all instructions. For complete module descriptions, see the *CC430 Family User's Guide* ([SLAU259](#)).

Oscillator and System Clock

The Unified Clock System (UCS) module includes support for a 32768-Hz watch crystal oscillator, an internal very-low-power low-frequency oscillator (VLO), an internal trimmed low-frequency oscillator (REFO), an integrated internal digitally-controlled oscillator (DCO), and a high-frequency crystal oscillator. The UCS module is designed to meet the requirements of both low system cost and low-power consumption. The UCS module features digital frequency locked loop (FLL) hardware that, in conjunction with a digital modulator, stabilizes the DCO frequency to a programmable multiple of the watch crystal frequency. The internal DCO provides a fast turn-on clock source and stabilizes in less than 5 μ s. The UCS module provides the following clock signals:

- Auxiliary clock (ACLK), sourced from a 32768-Hz watch crystal, a high-frequency crystal, the internal low-frequency oscillator (VLO), or the trimmed low-frequency oscillator (REFO).
- Main clock (MCLK), the system clock used by the CPU. MCLK can be sourced by same sources made available to ACLK.
- Sub-Main clock (SMCLK), the subsystem clock used by the peripheral modules. SMCLK can be sourced by same sources made available to ACLK.
- ACLK/ n , the buffered output of ACLK, ACLK/2, ACLK/4, ACLK/8, ACLK/16, ACLK/32.

Power Management Module (PMM)

The PMM includes an integrated voltage regulator that supplies the core voltage to the device and contains programmable output levels to provide for power optimization. The PMM also includes supply voltage supervisor (SVS) and supply voltage monitoring (SVM) circuitry, as well as brownout protection. The brownout circuit is implemented to provide the proper internal reset signal to the device during power-on and power-off. The SVS/SVM circuitry detects if the supply voltage drops below a user-selectable level and supports both supply voltage supervision (the device is automatically reset) and supply voltage monitoring (SVM, the device is not automatically reset). SVS and SVM circuitry is available on the primary supply and core supply.

Digital I/O

There are up to five 8-bit I/O ports implemented: ports P1 through P5.

- All individual I/O bits are independently programmable.
- Any combination of input, output, and interrupt conditions is possible.
- Programmable pullup or pulldown on all ports.
- Programmable drive strength on all ports.
- Edge-selectable interrupt and LPM3.5 and LPM4.5 wake-up input capability is available for all the eight bits of ports P1 and P2.
- Read and write access to port-control registers is supported by all instructions.
- Ports can be accessed byte-wise (P1 through P5) or word-wise in pairs (PA and PB).

Port Mapping Controller

The port mapping controller allows the flexible and re-configurable mapping of digital functions to port pins of ports P1 through P3.

(1) Input or output function is selected by the corresponding setting in the port direction register PxDIR.

(2) UART or SPI functionality is determined by the selected USCI mode.

(3) UCA0CLK function takes precedence over UCB0STE function. If the mapped pin is required as UCA0CLK input or output, USCI_B0 is forced to 3-wire SPI mode even if 4-wire mode is selected.

(4) SPI or I2C functionality is determined by the selected USCI mode. If I2C functionality is selected, the output of the mapped pin drives only the logical 0 to V_{SS} level.

- (6) The value of the PM_ANALOG mnemonic is set to 0FFh. The port mapping registers are only 5 bits wide and the upper bits are ignored resulting in a read out value of 31.

System Module (SYS)

The SYS module handles many of the system functions within the device. These include power on reset and power up clear handling, NMI source selection and management, reset interrupt vector generators, boot strap loader entry mechanisms, as well as, configuration management (device descriptors). It also includes a data exchange mechanism via JTAG called a JTAG mailbox that can be used in the application.

DMA Controller

The DMA controller allows movement of data from one memory address to another without CPU intervention. Using the DMA controller can increase the throughput of peripheral modules. The DMA controller reduces system power consumption by allowing the CPU to remain in sleep mode, without having to awaken to move data to or from a peripheral.

 (2) Only on CC430F614x and CC430F514x. Reserved on CC430F512x.

Watchdog Timer (WDT_A)

The primary function of the watchdog timer is to perform a controlled system restart after a software problem occurs. If the selected time interval expires, a system reset is generated. If the watchdog function is not needed in an application, the timer can be configured as an interval timer and can generate interrupts at selected time intervals.

CRC16

The CRC16 module produces a signature based on a sequence of entered data values and can be used for data checking purposes. The CRC16 module signature is based on the CRC-CCITT standard.

Hardware Multiplier

The multiplication operation is supported by a dedicated peripheral module. The module performs operations with 32-bit, 24-bit, 16-bit, and 8-bit operands. The module is capable of supporting signed and unsigned multiplication as well as signed and unsigned multiply and accumulate operations.

AES128 Accelerator

The AES accelerator module performs encryption and decryption of 128-bit data with 128-bit keys according to the Advanced Encryption Standard (AES) (FIPS PUB 197) in hardware.

Universal Serial Communication Interface (USCI)

The USCI module is used for serial data communication. The USCI module supports synchronous communication protocols such as SPI (3 or 4 pin) and I²C, and asynchronous communication protocols such as UART, enhanced UART with automatic baudrate detection, and IrDA.

The USCI_An module provides support for SPI (3 or 4 pin), UART, enhanced UART, and IrDA.

The USCI_Bn module provides support for SPI (3 or 4 pin) and I2C.

A USCI_A0 and USCI_B0 module are implemented.

TA0

TA0 is a 16-bit timer/counter (Timer_A type) with five capture/compare registers. TA0 can support multiple capture/compares, PWM outputs, and interval timing. TA0 also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

(1) If a different RFCLK divider setting is selected for a radio GDO output, this divider setting is also used for the Timer_A INCLK.

(2) Only on CC430F614x and CC430F514x.

TA1

TA1 is a 16-bit timer/counter (Timer_A type) with three capture/compare registers. TA1 can support multiple capture/compares, PWM outputs, and interval timing. TA1 also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

(1) If a different RFCLK divider setting is selected for a radio GDO output, this divider setting is also used for the Timer_A INCLK.

Real-Time Clock (RTC_D)

The RTC_D module can be used as a general-purpose 32-bit counter (counter mode) or as an integrated real-time clock (RTC) (calendar mode). In counter mode, the RTC_D also includes two independent 8-bit timers that can be cascaded to form a 16-bit timer/counter. Both timers can be read and written by software. Calendar mode integrates an internal calendar which compensates for months with less than 31 days and includes leap year correction. The RTC_D also supports flexible alarm functions and offset-calibration hardware.

REF Voltage Reference (Including Output)

The reference module (REF) is responsible for generation of all critical reference voltages that can be used by the various analog peripherals in the device. These include the ADC10_A, LCD_B, and COMP_B modules.

It can also provide the ADC reference voltages to the VREF+ pin (see the pin schematics).

LCD_B (Only CC430F614x)

The LCD_B driver generates the segment and common signals required to drive a Liquid Crystal Display (LCD). The LCD_B controller has dedicated data memories to hold segment drive information. Common and segment signals are generated as defined by the mode. Static, 2-mux, 3-mux, and 4-mux LCDs are supported. The module can provide a LCD voltage independent of the supply voltage with its integrated charge pump. It is possible to control the level of the LCD voltage and thus contrast by software. The module also provides an automatic blinking capability for individual segments.

Comparator_B

The primary function of the Comparator_B module is to support precision slope analog-to-digital conversions, battery voltage supervision, and monitoring of external analog signals.

ADC10_A (Only CC430F614x and CC430F514x)

The ADC10_A module supports fast, 10-bit analog-to-digital conversions. The module implements a 10-bit SAR core, sample select control, reference generator and a conversion result buffer. A window comparator with a lower and upper limit allows CPU independent result monitoring with three window comparator interrupt flags.

Embedded Emulation Module (EEM) (S Version)

The Embedded Emulation Module (EEM) supports real-time in-system debugging. The S version of the EEM implemented on all devices has the following features:

- Three hardware triggers or breakpoints on memory access
- One hardware trigger or breakpoint on CPU register write access
- Up to four hardware triggers can be combined to form complex triggers or breakpoints
- One cycle counter
- Clock control on module level

Absolute Maximum Ratings⁽¹⁾

over operating free-air temperature range (unless otherwise noted)

Voltage applied at DVCC and AVCC pins to V _{SS}	-0.3 V to 4.1 V
Voltage applied to any pin (excluding V _{CORE} , RF_P, RF_N, and R_BIAS) ⁽²⁾	-0.3 V to (V _{CC} + 0.3 V), 4.1 V Maximum
Voltage applied to V _{CORE} , RF_P, RF_N, and R_BIAS ⁽²⁾	-0.3 V to 2.0 V
Input RF level at pins RF_P and RF_N	10 dBm
Diode current at any device terminal	±2 mA
Storage temperature range ⁽³⁾ , T _{stg}	-55°C to 150°C
Maximum junction temperature, T _J	95°C

- (1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages referenced to V_{SS}.
- (3) Higher temperature may be applied during board soldering according to the current JEDEC J-STD-020 specification with peak reflow temperatures not higher than classified on the device label on the shipping boxes or reels.

Recommended Operating Conditions

Typical values are specified at V_{CC} = 3.3 V and T_A = 25°C (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V _{CC}	Supply voltage range applied at all DVCC and AVCC pins ⁽¹⁾⁽²⁾ during program execution and flash programming with PMM default settings. Radio is not operational with PMMCOREV _x = 0, 1. ⁽³⁾	PMMCOREV _x = 0 (default after POR)	1.8	3.6	V
		PMMCOREV _x = 1	2.0	3.6	V
V _{CC}	Supply voltage range applied at all DVCC and AVCC pins ⁽¹⁾⁽²⁾ during program execution, flash programming and radio operation with PMM default settings. ⁽³⁾	PMMCOREV _x = 2	2.2	3.6	V
		PMMCOREV _x = 3	2.4	3.6	V
V _{CC}	Supply voltage range applied at all DVCC and AVCC pins ⁽¹⁾⁽²⁾ during program execution, flash programming and radio operation with PMMCOREV _x = 2, high-side SVS level lowered (SVSHRVL _x = SVSHRRRL _x = 1) or high-side SVS disabled (SVSHE = 0). ⁽⁴⁾⁽³⁾	PMMCOREV _x = 2, SVSHRVL _x = SVSHRRRL _x = 1 or SVSHE = 0	2.0	3.6	V
V _{SS}	Supply voltage applied at the exposed die attach VSS and AVSS pin		0		V
T _A	Operating free-air temperature	-40		85	°C
T _J	Operating junction temperature	-40		85	°C
C _{V_{CORE}}	Recommended capacitor at V _{CORE}		470		nF
C _{V_{CORE}}	Reduced capacitor at V _{CORE}	f _{SYSTEM} ≤ 16 MHz, PMMCOREV _x ≤ 2, V _{CC} ≥ 2.2 V	100		nF
C _{DVCC}	Recommended capacitor at DVCC		4.7		μF

- (1) It is recommended to power AVCC and DVCC from the same source. A maximum difference of 0.3 V between AVCC and DVCC can be tolerated during power up and operation.
- (2) The minimum supply voltage is defined by the supervisor SVS levels when it is enabled. See the [PMM, SVS High Side](#) threshold parameters for the exact values and further details.
- (3) Modules may have a different supply voltage range specification. See the specification of the respective module in this data sheet.
- (4) Lowering the high-side SVS level or disabling the high-side SVS might cause the LDO to operate out of regulation but the core voltage still stays within its limits and is still supervised by the low-side SVS to ensure reliable operation.

Recommended Operating Conditions (continued)

Typical values are specified at $V_{CC} = 3.3\text{ V}$ and $T_A = 25^\circ\text{C}$ (unless otherwise noted)

		MIN	NOM	MAX	UNIT
f_{SYSTEM}	Processor (MCLK) frequency ⁽⁵⁾ (see Figure 2)	PMMCOREVx = 0 (default condition)	0	8	MHz
		PMMCOREVx = 1	0	12	MHz
		PMMCOREVx = 2	0	16	MHz
		PMMCOREVx = 3	0	20	MHz
P_{INT}	Internal power dissipation	$V_{CC} \times I_{DVCC}$			W
P_{IO}	I/O power dissipation of I/O pins powered by DVCC	$(V_{CC} - V_{\text{IOH}}) \times I_{\text{IOH}} + V_{\text{IOL}} \times I_{\text{IOL}}$			W
P_{MAX}	Maximum allowed power dissipation, $P_{\text{MAX}} > P_{\text{IO}} + P_{\text{INT}}$	$(T_J - T_A) / \theta_{JA}$			W

(5) Modules may have a different maximum input clock specification. See the specification of the respective module in this data sheet.

The numbers within the fields denote the supported PMMCOREVx settings.

- (1) To improve EMI on the XT1 oscillator, the following guidelines should be observed.
 - (a) Keep the trace between the device and the crystal as short as possible.
 - (b) Design a good ground plane around the oscillator pins.
 - (c) Prevent crosstalk from other clock or data lines into oscillator pins XIN and XOUT.
 - (d) Avoid running PCB traces underneath or adjacent to the XIN and XOUT pins.
 - (e) Use assembly materials and praxis to avoid any parasitic load on the oscillator XIN and XOUT pins.
 - (f) If conformal coating is used, ensure that it does not induce capacitive or resistive leakage between the oscillator pins.
- (2) When XT1BYPASS is set, XT1 circuits are automatically powered down. Input signal is a digital square wave with parametrics defined in the Schmitt-trigger Inputs section of this datasheet.
- (3) Maximum frequency of operation of the entire device cannot be exceeded.
- (4) Oscillation allowance is based on a safety factor of 5 for recommended crystals. The oscillation allowance is a function of the XT1DRIVE_x settings and the effective load. In general, comparable oscillator allowance can be achieved based on the following guidelines, but should be evaluated based on the actual crystal selected for the application:
 - (a) For XT1DRIVE_x = 0, C_{L,eff} ≤ 6 pF
 - (b) For XT1DRIVE_x = 1, 6 pF ≤ C_{L,eff} ≤ 9 pF
 - (c) For XT1DRIVE_x = 2, 6 pF ≤ C_{L,eff} ≤ 10 pF
 - (d) For XT1DRIVE_x = 3, C_{L,eff} ≥ 6 pF
- (5) Includes parasitic bond and package capacitance (approximately 2 pF per pin).
Since the PCB adds additional capacitance, it is recommended to verify the correct load by measuring the ACLK frequency. For a correct setup, the effective load capacitance should always match the specification of the used crystal.
- (6) Requires external capacitors at both terminals. Values are specified by crystal manufacturers.
- (7) Frequencies below the MIN specification set the fault flag. Frequencies above the MAX specification do not set the fault flag. Frequencies in between might set the flag.
- (8) Measured with logic-level input frequency but also applies to operation with crystals.

- (1) When selecting the proper DCO frequency range (DCORSELx), the target DCO frequency, f_{DCO} , should be set to reside within the range of $f_{DCO(n,0),MAX} \leq f_{DCO} \leq f_{DCO(n,31),MIN}$, where $f_{DCO(n,0),MAX}$ represents the maximum frequency specified for the DCO frequency, range n, tap 0 (DCOx = 0) and $f_{DCO(n,31),MIN}$ represents the minimum frequency specified for the DCO frequency, range n, tap 31 (DCOx = 31). This ensures that the target DCO frequency resides within the range selected. It should also be noted that if the actual f_{DCO} frequency for the selected range causes the FLL or the application to select tap 0 or 31, the DCO fault flag is set to report that the selected range is at its minimum or maximum tap setting.

$t_{WAKE-UP-RESET}$	Wake-up time from \overline{RST} or BOR event to active mode ⁽³⁾			2	3	ms

(1) This value represents the time from the wakeup event to the first active edge of MCLK. The wakeup time depends on the performance mode of the low-side supervisor (SVS_L) and low side monitor (SVM_L). Fastest wakeup times are possible with SVS_L and SVM_L in full performance mode or disabled when operating in AM, LPM0, and LPM1. Various options are available for SVS_L and SVM_L while operating in LPM2, LPM3, and LPM4. See the *Power Management Module and Supply Voltage Supervisor* chapter in the *CC430 Family User's Guide (SLAU259)*.

(2) This value represents the time from the wakeup event to the first active edge of MCLK. The wakeup time depends on the performance mode of the low-side supervisor (SVS_L) and low side monitor (SVM_L). In this case, the SVS_L and SVM_L are in normal mode (low current) mode when operating in AM, LPM0, and LPM1. Various options are available for SVS_L and SVM_L while operating in LPM2, LPM3, and LPM4. See the *Power Management Module and Supply Voltage Supervisor* chapter in the *CC430 Family User's Guide (SLAU259)*.

(3) This value represents the time from the wakeup event to the reset vector execution.

- (1) The external reference is used during ADC conversion to charge and discharge the capacitance array. The input capacitance, C_I, is also the dynamic load for an external reference during conversion. The dynamic impedance of the reference supply should follow the recommendations on analog-source impedance to allow the charge to settle for 12-bit accuracy.
- (2) The accuracy limits the minimum positive external reference voltage. Lower reference voltage levels may be applied with reduced accuracy requirements.
- (3) The accuracy limits the maximum negative external reference voltage. Higher reference voltage levels may be applied with reduced accuracy requirements.
- (4) The accuracy limits minimum external differential reference voltage. Lower differential reference voltage levels may be applied with reduced accuracy requirements.
- (5) Two decoupling capacitors, 10 μF and 100 nF, should be connected to VEREF to decouple the dynamic current required for an external reference source if it is used for the ADC10_A. See also the *CC430 Family User's Guide* (SLAU259).

- (1) The leakage current is defined in the leakage current table with P2.x/Ax parameter.
- (2) The internal reference current is supplied via terminal AVCC. Consumption is independent of the ADC10ON control bit, unless a conversion is active. The REFON bit enables to settle the built-in reference before starting an A/D conversion.
- (3) Contribution only due to the reference and buffer including package. This does not include resistance due to PCB trace and other factors. Positive load currents are flowing into the device.
- (4) Calculated using the box method: (MAX(-40 to 85°C) - MIN(-40 to 85°C)) / MIN(-40 to 85°C)/(85°C - (-40°C)).
- (5) The sensor current I_{SENSOR} is consumed if (ADC10ON = 1 and REFON = 1) or (ADC10ON = 1 and INCH = 0Ah and sample signal is high). When REFON = 1, I_{SENSOR} is already included in I_{REF+}.
- (6) The temperature sensor offset can be as much as ±20°C. A single-point calibration is recommended to minimize the offset error of the built-in temperature sensor.
- (7) The typical equivalent impedance of the sensor is 51 kΩ. The sample time required includes the sensor-on time t_{SENSOR(on)}.
- (8) The on-time t_{MID(on)} is included in the sampling time t_{MID(sample)}; no additional on time is needed.

$DV_{CC(PGM/ERASE)}$	Program or erase supply voltage		1.8		3.6	V
I_{PGM}	Average supply current from DVCC during program			3	5	mA
I_{ERASE}	Average supply current from DVCC during erase			2	6.5	mA
I_{MERASE}, I_{BANK}	Average supply current from DVCC during mass erase or bank erase			2	6.5	mA
t_{CPT}	Cumulative program time ⁽¹⁾				16	ms
	Program and erase endurance		10^4	10^5		cycles
$t_{Retention}$	Data retention duration	$T_J = 25^\circ\text{C}$	100			years
t_{Word}	Word or byte program time ⁽²⁾		64		85	μs
$t_{Block, 0}$	Block program time for first byte or word ⁽²⁾		49		65	μs
$t_{Block, 1-(N-1)}$	Block program time for each additional byte or word, except for last byte or word ⁽²⁾		37		49	μs
$t_{Block, N}$	Block program time for last byte or word ⁽²⁾		55		73	μs
t_{Erase}	Erase time for segment erase, mass erase, and bank erase when available ⁽²⁾		23		32	ms
$f_{MCLK, MGR}$	MCLK frequency in marginal read mode (FCTL4.MGR0 = 1 or FCTL4.MGR1 = 1)		0		1	MHz

- (1) The cumulative program time must not be exceeded when writing to a 128-byte flash block. This parameter applies to all programming methods: individual word/byte write and block write modes.
 (2) These values are hardwired into the flash controller's state machine.

JTAG and Spy-Bi-Wire Interface

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
f_{SBW}	Spy-Bi-Wire input frequency	2.2 V, 3 V	0		20	MHz
$t_{SBW, Low}$	Spy-Bi-Wire low clock pulse length	2.2 V, 3 V	0.025		15	μs
$t_{SBW, En}$	Spy-Bi-Wire enable time (TEST high to acceptance of first clock edge) ⁽¹⁾	2.2 V, 3 V			1	μs
$t_{SBW, Rst}$	Spy-Bi-Wire return to normal operation time		15		100	μs
f_{TCK}	TCK input frequency - 4-wire JTAG ⁽²⁾	2.2 V	0		5	MHz
		3 V	0		10	MHz
$R_{Internal}$	Internal pull-down resistance on TEST	2.2 V, 3 V	45	60	80	k Ω

- (1) Tools accessing the Spy-Bi-Wire interface need to wait for the minimum $t_{SBW, En}$ time after pulling the TEST/SBWTCK pin high before applying the first SBWTCK clock edge.
 (2) f_{TCK} may be restricted to meet the timing requirements of the module selected.

RF1A CC1101-Based Radio Parameters

RF1A Recommended Operating Conditions

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
V _{CC}	Supply voltage range during radio operation	2.0		3.6	V
PMMCOREVx	Core voltage range, PMMCOREVx setting during radio operation	2		3	
RF frequency range	300 MHz range	300		348	MHz
	400 MHz range	389 ⁽¹⁾		464	
	800 and 900 MHz range	779		928	
Data rate	2-FSK	0.6		500	kBaud
	2-GFSK, OOK, and ASK	0.6		250	
	(Shaped) MSK (also known as differential offset QPSK) ⁽²⁾	26		500	
RF crystal frequency			26	27	MHz
RF crystal tolerance	Total tolerance including initial tolerance, crystal loading, aging and temperature dependency ⁽³⁾		±40		ppm
RF crystal load capacitance		10	13	20	pF
RF crystal effective series resistance				100	Ω

(1) If using a 27-MHz crystal, the lower frequency limit for this band is 392 MHz.

(2) If using optional Manchester encoding, the data rate in kbps is half the baud rate.

(3) The acceptable crystal tolerance depends on frequency band, channel bandwidth, and spacing. Also see design note *DN005 -- CC11xx Sensitivity versus Frequency Offset and Crystal Accuracy (SWRA122)*.

RF Crystal Oscillator, XT2

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Start-up time ⁽²⁾			150	810	μs
Duty cycle		45	50	55	%

(1) All measurement results are obtained using the EM430F6137RF900 with BOM according to tested frequency range (see [Table 49](#)).

(2) The start-up time depends to a very large degree on the used crystal.

Current Consumption, Reduced-Power Modes

T_A = 25°C, V_{CC} = 3 V (unless otherwise noted)⁽¹⁾

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Current consumption	RF crystal oscillator only (for example, SLEEP state with MCSM0.OSC_FORCE_ON = 1)		100		μA
	IDLE state (including RF crystal oscillator)		1.7		mA
	FSTXON state (only the frequency synthesizer is running) ⁽²⁾		9.5		mA

(1) All measurement results are obtained using the EM430F6137RF900 with BOM according to tested frequency range (see [Table 49](#)).

(2) This current consumption is also representative of other intermediate states when going from IDLE to RX or TX, including the calibration state.

Current Consumption, Receive Mode

- (1) All measurement results are obtained using the EM430F6137RF900 with BOM according to tested frequency range (see Table 49).
- (2) Differential impedance as seen from the RF-port (RF_P and RF_N) towards the antenna. Follow the CC430 reference designs available from the TI website.
- (3) Output power is programmable, and full range is available in all frequency bands. Output power may be restricted by regulatory limits. See also application note AN050 Using the CC1101 in the European 868 MHz SRD Band (SWRA146) and design note DN013 Programming Output Power on CC1101 (SWRA151), which gives the output power and harmonics when using multi-layer inductors. The output power is then typically +10 dBm when operating at 868 or 915 MHz.
- (4) The antennas used during the radiated measurements (SMAFF-433 from R.W.Badland and Nearson S331 868 or 915) play a part in attenuating the harmonics.
- (5) Measured on EM430F6137RF900 with CW, maximum output power
- (6) All harmonics are below -41.2 dBm when operating in the 902 to 928 MHz band.
- (7) Requirement is -20 dBc under FCC 15.247
- (8) All radiated spurious emissions are within the limits of ETSI. Also see design note DN017 CC11xx 868/915 MHz RF Matching (SWRA168).
- (9) Time from sampling the data on the transmitter data input pin until it is observed on the RF output ports

PLL TX to RX settling time ⁽⁶⁾		20.7		21.5	µs
PLL calibration time ⁽⁷⁾		694		721	µs

(1) All measurement results are obtained using the EM430F6137RF900 with BOM according to tested frequency range (see [Table 49](#)).

(2) The resolution (in Hz) is equal for all frequency bands.

(3) Depends on crystal used. Required accuracy (including temperature and aging) depends on frequency band and channel bandwidth / spacing.

(4) Time from leaving the IDLE state until arriving in the RX, FSTXON, or TX state when not performing calibration.

(5) Settling time for the 1-IF frequency step from RX to TX

(6) Settling time for the 1-IF frequency step from TX to RX

(7) Calibration can be initiated manually or automatically before entering or after leaving RX/TX

- (1) According to mapped function (see Table 10)
- (2) Setting P2SEL.x bit together with P2MAPx = PM_ANALOG disables the output driver and the input Schmitt trigger.
- (3) Setting the CBPD.x bit disables the output driver and the input Schmitt trigger to prevent parasitic cross currents when applying analog signals. Selecting the CBx input pin to the comparator multiplexer with the CBx bits automatically disables output driver and input buffer for that pin, regardless of the state of the associated CBPD.x bit.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

⁽²⁾ **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of ≤ 1000 ppm threshold. Antimony trioxide based flame retardants must also meet the ≤ 1000 ppm threshold requirement.

⁽³⁾ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

RGZ (S-PVQFN-N48)

PLASTIC QUAD FLATPACK NO-LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
