

### Features

- ☑ Transmission distance up to 1.4km (SM fiber)
- ☑ Low power consumption
- ☑ Wide case operating temperature range
- ☑ Compliant with SFP+ Electrical MSA SFF-8431
- ☑ Compliant with SFP+ Mechanical MSA SFF-8432
- ☑ Digital Diagnostics Monitoring (DDM) through Serial Interface compliant with SFF-8472, Rev. 12.0
- ☑ Laser Class 1 IEC/CDRH compliant

### Description

The 1837xxxxxx is an enhanced small form factor pluggable (SFP+) fiber optic transceiver with digital diagnostics monitoring functionality (DDM). Compliance with Ethernet standard makes it ideally suited for 10Gbps data-com applications. DDM functionality (alarm and warning features) is integrated into the design via an I<sup>2</sup>C serial interface per the Multi-Source Agreement (MSA) SFF-8472, Rev. 12.0.

The transceiver supports 10.3Gbps data rates. It provides an excellent solution for data transmission at 1310nm over up to 1.4km single mode fiber. The sub-watt power consumption and excellent EMI performance allow system design with high port density. The product is RoHS compliant and is designed and tested in accordance with industry safety standards. The transceiver is Class 1 Laser product per U.S. FDA/CDRH and international IEC-60825 standards.

The 1837xxxxxx transceiver connects to standard 20-pad SFP+ connectors for hot plug capability. This allows the system designer to make configuration changes or maintenance by simply plugging in different transceivers without removing the power supply from the host system. The transmitter and receiver DATA interfaces are internally AC-coupled. LV-TTL Transmitter Disable control input and Loss of Signal (LOS) output interfaces are also provided.

The transceiver has bail-type latch, which offers an easy and convenient way to release the modules. The latch is compliant with the SFP MSA.

The transceiver operates from a single +3.3V power supply over a case operating temperature range of -5°C to +70°C (Commercial) or -5°C to +85°C (Extended) or -40°C to +85°C (Industrial)., The housing is made of metal for EMI immunity.

## Application Notes

**Electrical interface:** All signal interfaces are compliant with the SFP+ MSA specification. The high speed DATA interface is differential AC-coupled internally and can be directly connected to a 3.3V SERDES IC. All low speed

control and sense output signals are open collector TTL compatible and should be pulled up with a 4.7 kΩ – 10 kΩ resistor on the host board.

**Loss of Signal (LOS):** The Loss of Signal circuit monitors the level of the incoming optical signal and generates logic HIGH when an insufficient photocurrent is produced.

**TX Fault:** The output indicates LOW when the transmitter is operating normally and HIGH with a laser fault including laser end-of-life. TX Fault is an open collector/drain output and should be pulled up with a 4.7 k $\Omega$  – 10 k $\Omega$  resistor on the host board.

**TX Disable:** When the TX Disable pin is at logic HIGH, the transmitter optical output is disabled. The laser is also disabled if this line is left floating, as it is pulled high inside the transceiver.

**Serial Identification and Monitoring:** The module definition of SFP is indicated by the MOD\_ABS pin and the 2-wire serial interface. Upon power up, the 2-wire interface appears as NC (no connection), and MOD\_ABS is TTL LOW. When the host system detects this condition, it activates the serial protocol (standard two-wire I<sup>2</sup>C serial

interface) and generates the serial clock signal (SCL). The positive edge clocks data into the EEPROM segments of the device that are not write protected, and the negative edge clocks data from the device. The serial data signal (SDA) is for serial data transfer. The host uses SDA in conjunction with SCL to mark the start and end of serial protocol activation. The supported monitoring functions are temperature, voltage, bias current, transmitter power, average receiver signal, all alarms and warnings, and software monitoring of TX Fault/LOS. The device is internally calibrated.

The data transfer protocol and the details of the mandatory and vendor specific data structures are defined in the SFP MSA, and SFF-8472, Rev. 12.0.

**Power supply and grounding:** The power supply line should be well-filtered. All power supply bypass capacitors should be as close to the transceiver module as possible.

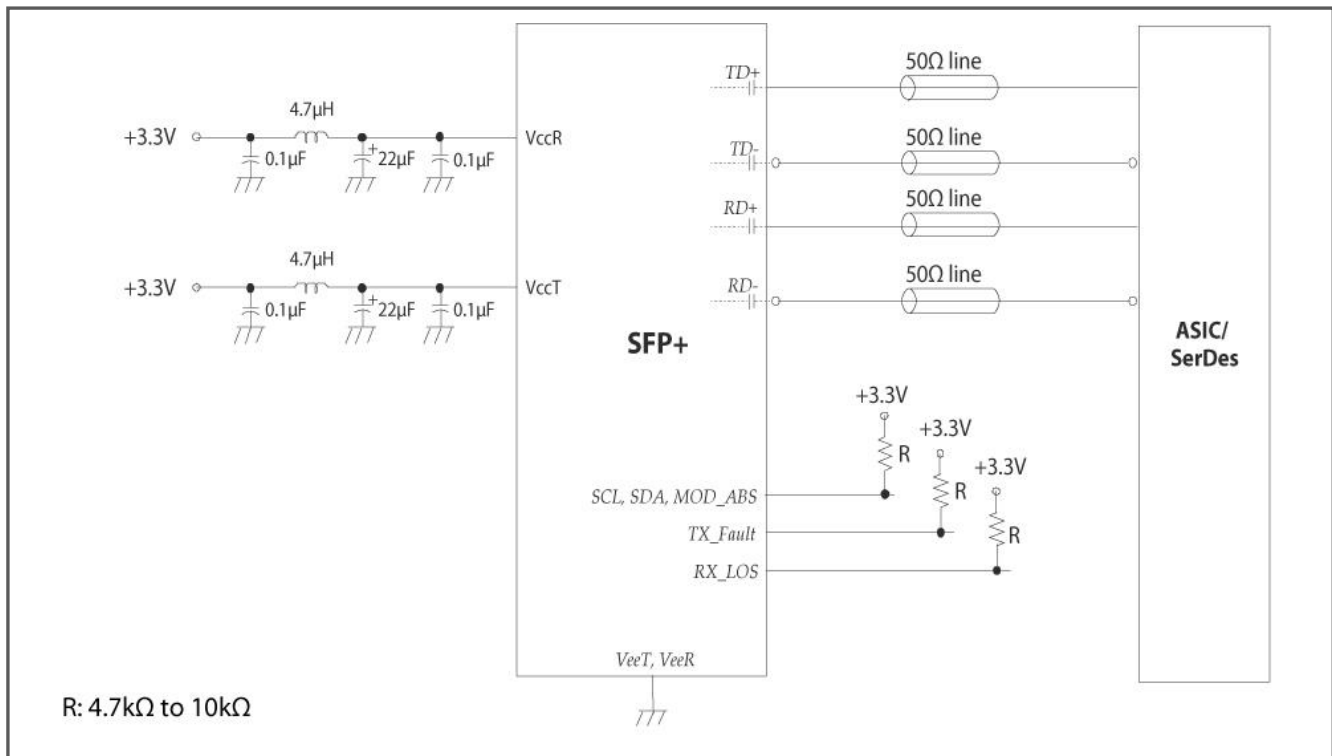

## Interfacing the Transceivers

Communication is via a serial 2-wire serial interface. As described in the document SFF-8472 (REV. 12.0) there are two distinct address spaces:

Base Address A0(hex)	
Byte Address	Content
0 – 95	Serial Transceiver ID as defined in SFP MSA
96 – 127	OPLINK Specific
128 – 255	Reserved

Base Address A2(hex)	
Byte Address	Content
0 - 55	Alarm & Warnings thresholds & limits
56 - 95	External calibration constants (not used)
96 – 119	Values from real time diagnostic monitoring
120 – 127	Not used
128 – 247	Customer specific, writable area
248 - 255	Not used
