

# FSDM0465RS

## Green Mode Fairchild Power Switch (FPS™)

### Features

- Internal Avalanche Rugged SenseFET
- Advanced Burst-Mode operation consumes under 1 W at 240V<sub>AC</sub> & 0.5W load
- Precision Fixed Operating Frequency (66kHz)
- Internal Start-up Circuit
- Improved Pulse-by-Pulse Current Limiting
- Over-Voltage Protection (OVP)
- Overload Protection (OLP)
- Internal Thermal Shutdown Function (TSD)
- Abnormal Over-Current Protection (AOCP)
- Auto-Restart Mode
- Under-Voltage Lock Out (UVLO) with hysteresis
- Low Operating Current (2.5mA)
- Built-in Soft-Start

### Applications

- SMPS for LCD monitor and STB
- Adaptor

### Description

The FSDM0465RS is an integrated Pulse Width Modulator (PWM) and SenseFET specifically designed for high-performance offline Switch Mode Power Supplies (SMPS) with minimal external components. This device is an integrated high-voltage power-switching regulator that combines an avalanche rugged SenseFET with a current mode PWM control block. The PWM controller includes integrated fixed frequency oscillator, under-voltage lockout, leading edge blanking (LEB), optimized gate driver, internal soft-start, temperature-compensated precise-current sources for a loop compensation and self-protection circuitry. Compared with a discrete MOSFET and PWM controller solution, it can reduce total cost, component count, size and weight; while simultaneously increasing efficiency, productivity and system reliability. This device is a basic platform well suited for cost effective designs of flyback converters.

### Ordering Information

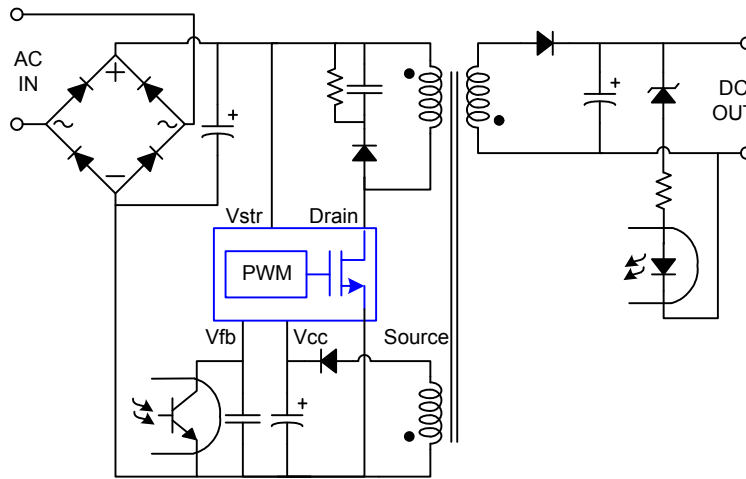

Product Number	Package	Marking Code	BV <sub>DSS</sub>	R <sub>DS(ON)</sub> Max.
FSDM0465RSWDTU <sup>(1)</sup>	TO-220F-6L(Forming) <sup>(2)</sup>	DM0465RS	650V	2.6 Ω

**Note:**

1. WDTU: Forming Type.
2. Pb-free package per JEDEC J-STD-020B.

FPS™ is a trademark of Fairchild Semiconductor Corporation.

## Typical Circuit

FSDM0465RS Rev: 00

Figure 1. Typical Flyback Application

## Output Power Table

Product	Maximum Output Power <sup>(3)</sup>			
	230VAC ±15% <sup>(4)</sup>		85–265VAC	
	Adapter <sup>(5)</sup>	Open Frame <sup>(6)</sup>	Adapter <sup>(5)</sup>	Open Frame <sup>(6)</sup>
FSDM0465RS	48W	56W	40W	48W

### Notes:

3. The junction temperature can limit the maximum output power.
4. 230V<sub>AC</sub> or 100/115V<sub>AC</sub> with doubler.
5. Typical continuous power in a non-ventilated enclosed adapter measured at 50°C ambient temperature.
6. Maximum practical continuous power in an open-frame design at 50°C ambient.

### Internal Block Diagram

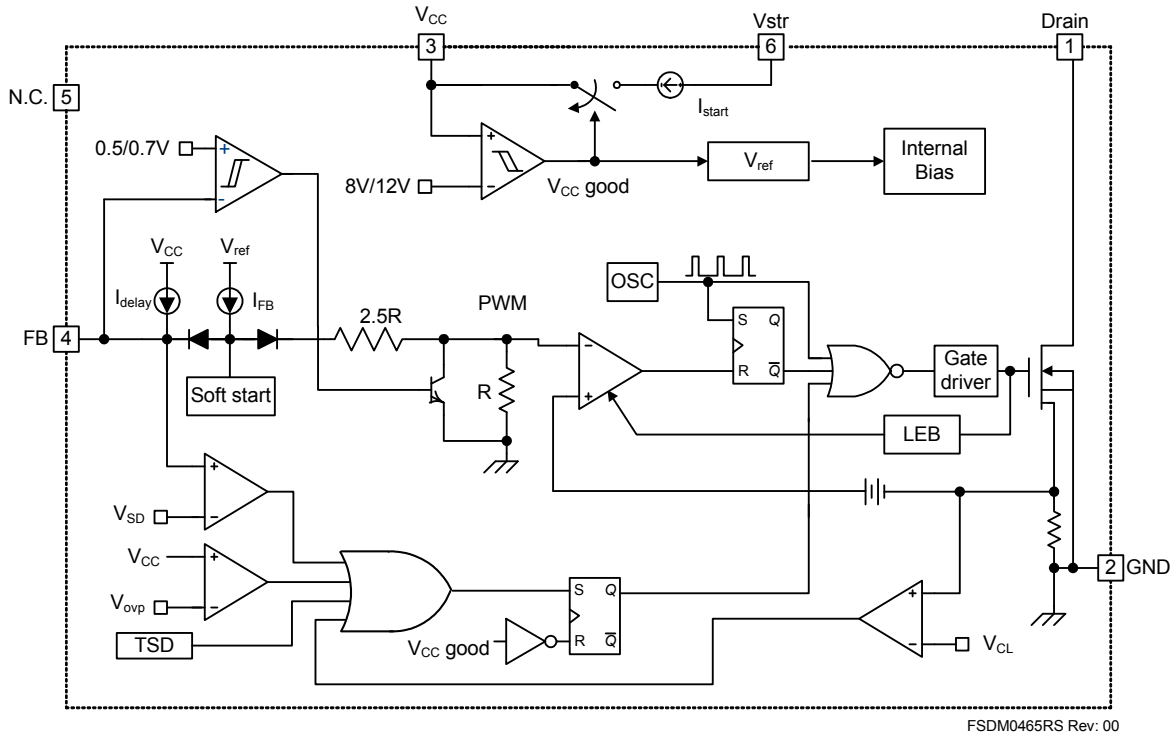

Figure 2. Functional Block Diagram of FSDM0465RS

## Pin Configuration

Figure 3. Pin Configuration (Top View)

## Pin Definitions

Pin #	Name	Description
1	Drain	<b>SenseFET drain.</b> High-voltage power SenseFET drain connection.
2	GND	<b>Ground.</b> This pin is the control ground and the SenseFET source.
3	$V_{CC}$	<b>Power Supply.</b> This pin is the positive supply input, providing internal operating current for both start-up and steady-state operation.
4	$V_{fb}$	<b>Feedback.</b> This pin is internally connected to the inverting input of the PWM comparator. The collector of an opto-coupler is typically tied to this pin. For stable operation, a capacitor should be placed between this pin and GND. If the voltage of this pin reaches 6V, the overload protection triggers, which shuts down the FPS.
5	N.C.	No Connection.
6	$V_{str}$	<b>Start-up.</b> This pin is connected directly, or through a resistor, to the high-voltage DC link. At start-up, the internal high-voltage current source supplies internal bias and charges the external capacitor connected to the $V_{CC}$ pin. Once $V_{CC}$ reaches 12V, the internal current source is disabled. It is not recommended to connect $V_{str}$ and Drain together.

## Absolute Maximum Ratings

The “Absolute Maximum Ratings” are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum ratings.

$T_A = 25^\circ\text{C}$ , unless otherwise specified.

Symbol	Parameter	Value	Unit
$BV_{DSS}$	Drain Source Breakdown Voltage	650	V
$V_{STR}$	Vstr Max. Voltage	650	V
$I_{DM}$	Drain Current Pulsed <sup>(7)</sup>	$T_c=25^\circ\text{C}$ 9.6	$A_{DC}$
$I_D$	Continuous Drain Current <sup>(8)</sup>	$T_c=25^\circ\text{C}$ 2.2	$A_{RMS}$
		$T_c=100^\circ\text{C}$ 1.4	$A_{RMS}$
$E_{AS}$	Single Pulsed Avalanche Energy <sup>(9)</sup>	120	mJ
$V_{CC}$	Supply Voltage	20	V
$V_{FB}$	Input Voltage Range	-0.3 to 12	V
$P_D(\text{Watt H/S})$	Total Power Dissipation ( $T_c=25^\circ\text{C}$ )	45	W
$T_j$	Operating Junction Temperature	Internally limited	$^\circ\text{C}$
$T_A$	Operating Ambient Temperature	-25 to +85	$^\circ\text{C}$
$T_{STG}$	Storage Temperature	-55 to +150	$^\circ\text{C}$
ESD	ESD Capability, HBM Model (All pins excepts for Vstr and Vfb)	2.0 (GND-Vstr/Vfb=1.5kV)	kV
	ESD Capability, Charged Device Model	1.0	kV

### Notes:

7. Repetitive rating: Pulse width limited by maximum junction temperature.
8. This value is RMS current rating which should not be confused by the switching current.
9.  $L=14\text{mH}$ , starting  $T_j=25^\circ\text{C}$ .

## Thermal Impedance

$T_A=25^\circ\text{C}$ , unless otherwise specified.

Symbol	Parameter	Value	Unit
$\theta_{JA}^{(10)}$	Junction-to-Ambient Thermal	50	$^\circ\text{C/W}$
$\theta_{JC}^{(11)}$	Junction-to-Case Thermal	2.78	$^\circ\text{C/W}$

### Notes:

10. Free standing with no heat-sink under natural convection.
11. Infinite cooling condition - Refer to the SEMI G30-88.

## Functional Description

**1. Startup:** In previous generations of Fairchild Power Switches (FPS™) the  $V_{CC}$  pin had an external start-up resistor to the DC input voltage line. In this generation the startup resistor is replaced by an internal high-voltage current source. At startup, an internal high-voltage current source supplies the internal bias and charges the external capacitor ( $C_{VCC}$ ) that is connected to the  $V_{CC}$  pin as illustrated in Figure 17. When  $V_{CC}$  reaches 12V, the FSDM0465RS begins switching and the internal high-voltage current source is disabled. Then, the FSDM0465RS continues its normal switching operation and the power is supplied from the auxiliary transformer winding unless  $V_{CC}$  goes below the stop voltage of 8V.

Figure 17. Internal startup circuit

**2. Feedback Control:** FSDM0465RS employs current mode control, as shown in Figure 18. An opto-coupler (such as the H11A817A) and shunt regulator (such as the KA431) are typically used to implement the feedback network. Comparing the feedback voltage with the voltage across the  $R_{sense}$  resistor plus an offset voltage makes it possible to control the switching duty cycle. When the reference pin voltage of the KA431 exceeds the internal reference voltage of 2.5V, the H11A817A LED current increases, thus pulling down the feedback voltage and reducing the duty cycle. This event typically happens when the input voltage is increased or the output load is decreased.

Figure 18. Pulse width modulation (PWM) circuit

**2.1 Pulse-by-Pulse Current Limit:** Because current mode control is employed, the peak current through the SenseFET is limited by the inverting input of PWM comparator ( $V_{fb}^*$ ) as shown in Figure 18. Assuming that the 0.9mA current source flows only through the internal resistor ( $2.5R + R = 2.8k\Omega$ ), the cathode voltage of diode D2 is about 2.5V. Since D1 is blocked when the feedback voltage ( $V_{fb}$ ) exceeds 2.5V, the maximum voltage of the cathode of D2 is clamped at this voltage, thus clamping  $V_{fb}^*$ . Therefore, the peak value of the current through the SenseFET is limited.

**2.2 Leading Edge Blanking (LEB):** At the instant the internal SenseFET is turned on, there usually exists a high-current spike through the SenseFET, caused by primary-side capacitance and secondary-side rectifier reverse recovery. Excessive voltage across the  $R_{sense}$  resistor would lead to incorrect feedback operation in the current mode PWM control. To counter this effect, the FSDM0465RS employs a leading edge blanking (LEB) circuit. This circuit inhibits the PWM comparator for a short time ( $t_{LEB}$ ) after the SenseFET is turned on.

**3. Protection Circuit:** The FSDM0465RS has several self protective functions such as overload protection (OLP), over-voltage protection (OVP) and thermal shutdown (TSD). Because these protection circuits are fully integrated into the IC without external components, the reliability can be improved without increasing cost. Once the fault condition occurs, switching is terminated and the SenseFET remains off. This causes  $V_{CC}$  to fall. When  $V_{CC}$  reaches the UVLO stop voltage, 8V, the protection is reset and the internal high-voltage current source charges the  $V_{CC}$  capacitor via the  $V_{str}$  pin. When  $V_{CC}$  reaches the UVLO start voltage, 12V, the FSDM0465RS resumes its normal operation. In this manner, the auto-restart can alternately enable and

disable the switching of the power SenseFET until the fault condition is eliminated (see Figure 19).

**Figure 19. Auto restart operation**

**3.1 Overload Protection (OLP):** Overload is defined as the load current exceeding a pre-set level due to an unexpected event. In this situation, the protection circuit should be activated to protect the SMPS. However, even when the SMPS is in the normal operation, the overload protection circuit can be activated during the load transition. To avoid this undesired operation, the overload protection circuit is designed to be activated after a specified time to determine whether it is a transient situation or an overload situation. Because of the pulse-by-pulse current limit capability, the maximum peak current through the SenseFET is limited, and therefore the maximum input power is restricted with a given input voltage. If the output consumes beyond this maximum power, the output voltage ( $V_O$ ) decreases below the set voltage. This reduces the current through the opto-coupler LED, which also reduces the opto-coupler transistor current, thus increasing the feedback voltage ( $V_{fb}$ ). If  $V_{fb}$  exceeds 2.5V, D1 is blocked and the  $3.5\mu\text{A}$  current source starts to charge  $C_B$  slowly up to  $V_{CC}$ . In this condition,  $V_{fb}$  continues increasing until it reaches 6V, when the switching operation is terminated as shown in Figure 20. The delay time for shutdown is the time required to charge  $C_B$  from 2.5V to 6.0V with  $3.5\mu\text{A}$ . In general, a 10 ~ 50 ms delay time is typical for most applications.

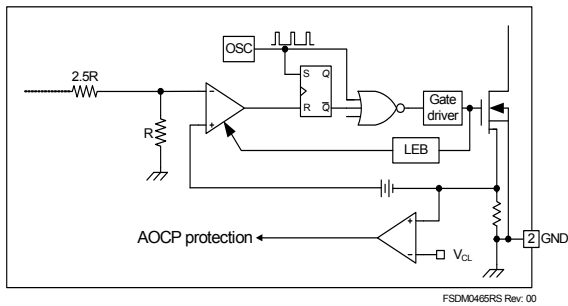

**Figure 20. Overload protection**

**3.2 Over-voltage Protection (OVP):** If the secondary side feedback circuit were to malfunction or a solder defect caused an open in the feedback path, the current through the opto-coupler transistor becomes almost zero. Then,  $V_{fb}$  climbs up in a similar manner to the overload situation, forcing the preset maximum current to be supplied to the SMPS until the overload protection is activated. Because more energy than required is provided to the output, the output voltage may exceed the rated voltage before the overload protection is activated, resulting in the breakdown of the devices in the secondary side. To prevent this situation, an over-voltage protection (OVP) circuit is employed. In general,  $V_{CC}$  is proportional to the output voltage and the FSDM0465RS uses  $V_{CC}$  instead of directly monitoring the output voltage. If  $V_{CC}$  exceeds 19V, an OVP circuit is activated resulting in the termination of the switching operation. To avoid undesired activation of OVP during normal operation,  $V_{CC}$  should be designed to be below 19V.

**3.3 Thermal Shutdown (TSD):** The SenseFET and the control IC are built in one package. This makes it easy for the control IC to detect the heat generation from the SenseFET. When the temperature exceeds approximately  $150^\circ\text{C}$ , the thermal shutdown is activated.

**4.2 Abnormal Over-Current Protection (AOCP):** When the secondary rectifier diodes or the transformer pins are shorted, a steep current with extremely high  $di/dt$  can flow through the SenseFET during the LEB time. Even though the FPS has overload protection, it is not enough to protect the FPS in those abnormal cases, since severe current stress is imposed on the SenseFET until OLP triggers. This IC has an internal AOCP circuit shown in Figure 21. When the gate turn-on signal is applied to the power SenseFET, the AOCP block is enabled and monitors the current through the sensing resistor. The voltage across the resistor is compared with a preset AOCP level. If the sensing resistor voltage is

greater than the AOC level, the set signal is applied to the latch, resulting in the shutdown of the SMPS.

**Figure 21. Abnormal Over-Current Protection**

**4. Soft-Start:** The FSDM0465RS has an internal soft-start circuit that increases PWM comparator inverting input voltage together with the SenseFET current slowly after it starts up. The typical soft-start time is 10msec. The pulse width to the power switching device is progressively increased to establish the correct working conditions for transformers, inductors, and capacitors. The voltage on the output capacitors is progressively increased with the intention of smoothly establishing the required output voltage. It also helps to prevent transformer saturation and reduce the stress on the secondary diode during startup.

**5. Burst operation:** To minimize power dissipation in standby mode, the FSDM0465RS enters burst mode operation. As the load decreases, the feedback voltage decreases. As shown in Figure 22, the device automatically enters burst mode when the feedback voltage drops below  $V_{BURL}(500mV)$ . At this point switching stops and the output voltages start to drop at a rate dependent on standby current load. This causes the feedback voltage to rise. Once it passes  $V_{BURH}(700mV)$  switching resumes. The feedback voltage then falls and the process repeats. Burst mode operation alternately enables and disables switching of the power SenseFET thereby reducing switching loss in Standby mode.

**Figure 22. Waveforms of Burst Operation**

## Typical application circuit

Application	Output power	Input voltage	Output voltage (Max current)
LCD Monitor	34W	Universal input (85-265Vac)	5V (2.0A) 12V (2.0A)

### Features

- High efficiency (>81% at 85Vac input)
- Low zero load power consumption (<300mW at 240Vac input)
- Low standby mode power consumption (<800mW at 240Vac input and 0.3W load)
- Low component count
- Enhanced system reliability through various protection functions
- Internal soft-start (10ms)

### Key Design Notes

- Resistors R102 and R105 are employed to prevent start-up at low input voltage. After startup, there is no power loss in these resistors since the startup pin is internally disconnected after start-up.
- The delay time for overload protection is designed to be about 50ms with C106 of 47nF. If a faster triggering of OLP is required, C106 can be reduced to 10nF.
- Zener diode ZD102 is used for a safety test such as UL. When the drain pin and feedback pin are shorted, the zener diode fails and remains short, which causes the fuse (F1) blown and prevents explosion of the opto-coupler (IC301). This zener diode also increases the immunity against line surge.

Datasheet Identification	Product Status	Definition
Advance Information	Formative or In Design	This datasheet contains the design specifications for product development. Specifications may change in any manner without notice.
Preliminary	First Production	This datasheet contains preliminary data; supplementary data will be published at a later date. Fairchild Semiconductor reserves the right to make changes at any time without notice to improve design.
No Identification Needed	Full Production	This datasheet contains final specifications. Fairchild Semiconductor reserves the right to make changes at any time without notice to improve design.
Obsolete	Not In Production	This datasheet contains specifications on a product that has been discontinued by Fairchild Semiconductor. The datasheet is printed for reference information only.
