

## Ultra-Fast Precision TTL Comparators

### General Description

The Maxim MXL1016 (10ns typ) and MXL1116 (12ns typ) high-speed, complementary-output comparators are designed specifically to interface directly to TTL logic while operating from either a dual  $\pm 5V$  supply or a single +5V supply.

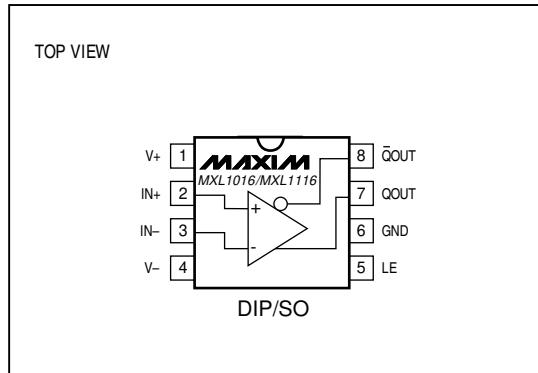

The MXL1016/MXL1116 remain stable with the outputs in the active region, which greatly reduces output instability common with slow-moving input signals. In addition, an output latch (LE) is provided.

For lower-power, higher-performance comparators, see the MAX912/MAX913 dual/single comparator data sheet. The MAX913 is an improved, plug-in replacement for the MXL1016 and MXL1116, and the MAX912 is the dual equivalent to the MAX913.

### Applications

- High-Speed A/D Converters
- Zero-Crossing Detectors
- Current Sense for Switching Regulators
- High-Speed Sampling Circuits
- High-Speed Triggers
- Line Receivers
- Extended Range V/F Converters
- Fast Pulse Height/Width Discriminators

### Pin Configuration

### Features

- ♦ Ultra Fast (10ns typ)
- ♦ Single +5V or Dual  $\pm 5V$  Supply Operation
- ♦ Input Common-Mode Extends to Negative Supply (MXL1116)
- ♦ Inputs Can Exceed the Positive Supply Up to +15V (MXL1116) Without Damage
- ♦ Complementary TTL Outputs
- ♦ Low Offset Voltage: 1mV
- ♦ No Minimum Input Slew-Rate Requirement
- ♦ No Power-Supply Current Spiking
- ♦ Output Latch

### Ordering Information

PART	TEMP. RANGE	PIN-PACKAGE
<b>MXL1016CN8</b>	0°C to +70°C	8 Plastic DIP
MXL1016CS8	0°C to +70°C	8 SO

### Pin Description

PIN	NAME	FUNCTION
1	V+	Positive Power Supply, +5V
2	IN+	Noninverting Input
3	IN-	Inverting Input
4	V-	Negative Power Supply, -5V for dual supply or GND for single supply
5	LE	Latch Enable, QOUT and $\bar{Q}$ OUT are latched when LE is high
6	GND	Ground
7	QOUT	TTL Output
8	$\bar{Q}$ OUT	Complementary TTL Output

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**Note 1:** Input offset voltage is defined as the average of the two input offset voltages, measured by forcing first one output, then the other to 1.4V. Input offset current is defined in the same way.

**Note 2:** Input bias current ( $I_B$ ) is defined as the average of the two input currents.

**Note 3:**  $t_{PD}$  and  $\Delta t_{PD}$  cannot be measured in automatic handling equipment with low values of overdrive. Correlation tests have shown that  $t_{PD}$  and  $\Delta t_{PD}$  limits shown can be guaranteed by design, if additional DC tests are performed to guarantee that all internal bias conditions are correct. For low overdrive conditions,  $V_{OS}$  is added to overdrive.

**Note 4:** Input latch setup time,  $t_{SU}$ , is the interval in which the input signal must be stable prior to asserting the latch signal. The hold time,  $t_H$ , is the interval after the latch is asserted in which the input signal must be stable.
