

## INTRODUCING TO PRODUCT

The LX2205 Evaluation Board is available from Microsemi for evaluating the performance of the LX2205 Battery Charger Integrated Circuit. The component sizes used on the evaluation board facilitate easy probing, however, in practice, smaller component sizes are recommended to minimize the circuit physical size.

## KEY FEATURES

- Charging up to 1A.
- Charging from USB port.
- USB current compliance
- Auto battery switchover
- CC/CV w thermal Feedback
- Battery temp monitor
- Precision Charge Termination

## APPLICATIONS

- Navigation Devices
- Portable USB Devices
- Multi-Media Player
- PDA Phones
- Digital Cameras

## LX2205 EVB TEST PROCEDURE

Connections. The LX2205 Evaluation Board has two power input and two power output connections. GND is the return for all inputs and outputs.

FUNCTION	PIN NAME	VOLTAGE
Adapter Power	MDC	5V +/- 0.65V
USB Power	USB	5V +/- 0.65V
Battery +	BAT+	0V to 4.3V
System Load	SYS LOAD	$2.8\Omega \leq R \leq \infty$

The following is a test procedure for the LX2205 evaluation board:

- Place the jumpers in the following positions:

VCC	Place in the BATTERY position.
SHDN	Place in the ON position.
SUSP	Place in the USB ON position.
UCL	Place in the USB HI position.

- Apply the Battery Simulator (referred to below as the battery) between the BAT terminal and GND terminal. Adjust the battery voltage to 3.9V.

3)

### Battery Simulator

- Verify the DCOK pin is  $>3.7V$ .
- Apply a 5.0V power source between the MDC terminal and GND terminal.
- Verify the CHG LED is illuminated.
- Verify the voltage at the DCOK test point is  $<100mV$ .
- Verify the current flowing into the battery is  $1000 \pm 150mA$ .
- Place the VCC jumper in the SYS position and verify the CHG LED is illuminated. Then place the VCC jumper in the BATTERY position.
- Place the SHDN jumper in the OFF position and verify the current flowing into the battery drops to  $0mA \pm 1mA$ . Then place the SHDN jumper in the ON position.
- Slowly adjust the battery voltage to 4.25V while monitoring the current flowing into the battery and verify the Battery Charge current drops to  $0mA \pm 1mA$ , the CHG LED shuts off and the DONE LED turns on. Just before the CHG LED turns off, verify the current flowing into the battery is less than 100mA but greater than 40mA.
- Set the battery voltage to 3.9V.
- Remove the 5.0V power source from the MDC terminal and apply it to the USB terminal.
- Verify the current flowing into the battery is between 425mA and 500mA.
- Place the UCL jumper in the USB LO position and verify the current flowing into the battery is between 85mA and 100mA.
- Place the SUSP jumper in the SUSPEND position and verify the current flowing into the battery drops to  $0mA \pm 1mA$ . Then place the SUSPEND jumper in the USB ON position.
- Place a  $20\Omega$  load from the SYS terminal and GND terminal and verify the CHG

LED and DONE LED are off. Verify the current flowing into the USB pin is 90mA +/- 10mA. Then remove the 20Ω load.

- 18) Monitor the battery current and apply heat (from a heat gun) to RT1. Verify that when RT1 gets hot, that the battery current drops to 0mA +/- 1mA. Verify

when the heat is removed, after a short wait to cool, that the battery current flowing into the battery is between 85mA and 100mA.

- 19) Place the jumpers in their initial positions.
- 20) Test COMPLETE.

## PCB LAYOUT RECOMMENDATIONS

It is recommended that C1 and C2 be located within 1cm of the LX2205. The CMP capacitor should be located close to the SYS and CMP pins. Also the high impedance summing node connecting to the TMP pin should be kept relatively short to prevent the coupling of noise into this node. It is important that

the LX2205 have a good thermal path to ambient to dissipate heat. The simplest way to do this is to heatsink the LX2205 bottom pad directly to the ground plane by placing 4 or more vias in the ground pad directly under the LX2205 footprint.
