# FAH4830
# Haptic Driver for DC Motors (ERMs) and Linear Resonant Actuators (LRAs)

## Features

- Direct Drive of ERM and LRA Motors
- External PWM Input (10 kHz to 50 kHz)
- External Motor Enable/Disable Input
- Internal Mode-Select Register: ERM or LRA
- Low Standby Current: <500 nA
- Fast Wake-up Time
- Nearly Rail-to-Rail Output Swing
- Register-Based Control by I²C
- Over Driving Motor Control
- Under-Voltage, Over-Current, and Over-Temperature Protections
- Settable Filter and External Gain Control
- Package: 10-Lead MLP

## Applications

- Mobile Phones
- Handheld Devices
- Any Key-Pad Interface

## Related Resources

- *AN-5067 — PCB Land Pattern Design and Surface-Mount Guidelines for MLP Packages*

## Description

The FAH4830 is a high-performance enhanced haptic drive for mobile phone and other hand-held devices. The haptic driver takes a single-ended PWM input signal to control a DC motor. It can drive both Eccentric Rotating Mass (ERM) and Linear Resonant Actuator (LRA) motors. The device utilizes an external 10 kHz to 50 kHz PWM signal capable of meeting the wide range of resonant frequencies.

The FAH4830 has its own register maps accessible via I²C serial communication. A gain control setting can be used to help prevent PWM noise from getting into the motor and to control the maximum output voltage on the motor. For ERM motors, the over-drive control block is designed to control the inertial momentum of the motor.

**Figure 1.     Block Diagram**

## Ordering Information

| Part Number | Operating Temperature Range | Package | Packing Method |
|---|---|---|---|
| FAH4830MPX | -40°C to +85°C | 10-Lead, Dual, JEDEC MO-229, 3mm Square, Molded Leadless Package (MLP) | 3000 Units on Tape & Reel |

www.fairchildsemi.com
## Pin Configuration

**Figure 2.    Pin Assignments (Top View)**

## Pin Definitions

| Name | Pin # | Type | Description |
|------|-------|------|-------------|
| VDD | 1 | Power | Power |
| GND | 2, 7 | Power | Ground |
| MDP | 3 | Output | Positive motor driver output |
| MDN | 4 | Output | Negative motor driver output |
| GAIN | 5 | Input | Gain control for motor driving (39 nF capacitor required to tied to MDN) |
| PWM | 6 | Input | PWM input |
| HEN | 8 | Input | Haptic motor enable/disable (HIGH: enable, LOW: disable) |
| SDA | 9 | Input | $I^2C$ data input |
| SCL | 10 | Input | $I^2C$ clock input |

**Note:**
1.   The exposed DAP should be connected to ground.

## Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

| Symbol | Parameter | Min. | Max. | Unit |
|---|---|---|---|---|
| $V_{DD}$ | DC Supply Voltage | -0.3 | 6.0 | V |
| $V_{IO}$ | Analog and Digital I/O (All Input and Output Pins) | -0.3 | $V_{CC}$+0.3 | V |

## Reliability Information

| Symbol | Parameter | Min. | Typ. | Max. | Unit |
|---|---|---|---|---|---|
| $T_J$ | Junction Temperature | | | +150 | °C |
| $T_{STG}$ | Storage Temperature Range | -65 | | +150 | °C |

## I$^2$C DC Electrical Characteristics

T$_A$ = 25°C, V$_{DD}$ = 3.3 V, and V$_{LDO}$ = 3.0 V unless otherwise noted.

| Symbol | Parameter | Fast Mode (400kHz) | | |
|---|---|---|---|---|
| | | Min. | Max. | Unit |
| V$_{IL}$ | Low-Level Input Voltage | -0.3 | 0.6 | V |
| V$_{IH}$ | High-Level Input Voltage | 1.3 | | V |
| V$_{OL}$ | Low-Level Output Voltage at 3 mA Sink Current (Open-Drain or Open-Collector) | 0 | 0.4 | V |
| I$_{IH}$ | High-Level Input Current of Each I/O Pin, Input Voltage = V$_{DD}$ | -1 | 1 | µA |
| I$_{IL}$ | Low-Level Input Current of Each I/O Pin, Input Voltage = 0 V | -1 | 1 | µA |

## I$^2$C AC Electrical Characteristics

| Symbol | Parameter | Fast Mode (400kHz) | | |
|---|---|---|---|---|
| | | Min. | Max. | Unit |
| f$_{SCL}$ | SCL Clock Frequency | 0 | 400 | kHz |
| t$_{HD;STA}$ | Hold Time (Repeated) START Condition | 0.6 | | µs |
| t$_{LOW}$ | Low Period of SCL Clock | 1.3 | | µs |
| t$_{HIGH}$ | High Period of SCL Clock | 0.6 | | µs |
| t$_{SU;STA}$ | Set-up Time for Repeated START Condition | 0.6 | | µs |
| t$_{HD;DAT}$ | Data Hold Time | 0 | 0.9 | µs |
| t$_{SU;DAT}$ | Data Set-up Time[2] | 100 | | ns |
| t$_r$ | Rise Time of SDA and SCL Signals[3] | 20+0.1C$_b$ | 300 | ns |
| t$_f$ | Fall Time of SDA and SCL Signals[3] | 20+0.1C$_b$ | 300 | ns |
| t$_{SU;STO}$ | Set-up Time for STOP Condition | 0.6 | | µs |
| t$_{BUF}$ | Bus-Free Time between STOP and START Conditions | 1.3 | | µs |
| t$_{SP}$ | Pulse Width of Spikes that Must Be Suppressed by the Input Filter | 0 | 50 | ns |

**Notes:**
2. A Fast-Mode I$^2$C Bus® device can be used in a Standard-Mode I$^2$C bus system, but the requirement t$_{SU;DAT}$ ≥ 250 ns must then be met. This is automatically the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the Serial Data (SDA) line t$_{r\_max}$ + t$_{SU;DAT}$ = 1000 + 250 = 1250 ns (according to the Standard-Mode I$^2$C Bus specification) before the SCL line is released.
3. C$_b$ equals the total capacitance of one bus line in pf. If mixed with High-Speed Mode devices, faster fall times are allowed according to the I$^2$C specification.

**Figure 4. Definition of Timing for Full-Speed Mode Devices on the I$^2$C Bus**

## Functional Description

### I²C Control

Writing to and reading from registers is accomplished via the I²C interface. The I²C protocol requires that one device on the bus initiates and controls all read and write operations. This device is called the "master" device. The master device generates the SCL signal, which is the clock signal for all other devices on the bus. All other devices on the bus are called "slave" devices. The FAH4830 is a slave device. Both the master and slave devices can send and receive data on the bus.

During I²C operations, one data bit is transmitted per clock cycle. All I²C operations follow a repeating nine-clock-cycle pattern that consists of eight bits (one byte) of transmitted data followed by an acknowledge (ACK) or not acknowledge (NACK) from the receiving device. Note that there are no unused clock cycles during any operation; therefore, there must be no breaks in the stream of data and ACKs/NACKs during data transfers.

For most operations, I²C protocol requires the SDA line remain stable (unmoving) whenever SCL is HIGH. For example, transitions on the SDA line can only occur when SCL is LOW. The exceptions are when the master device issues a START or STOP condition. The slave device cannot issue a START or STOP condition.

**START Condition:** This condition occurs when the SDA line transitions from HIGH to LOW while SCL is HIGH. The master device uses this condition to indicate that a data transfer is about to begin.

**STOP Condition:** This condition occurs when the SDA line transitions from LOW to HIGH while SCL is HIGH. The master device uses this condition to signal the end of a data transfer.

**Acknowledge and Not Acknowledge:** When data is transferred to the slave device, the slave device sends acknowledge (ACK) after receiving every byte of data. The receiving device sends an ACK by pulling SDA LOW for one clock cycle.

When the master device is reading data from the slave device, the master sends an ACK after receiving every byte of data. Following the last byte, a master device sends a "not acknowledge" (NACK) instead of an ACK, followed by a STOP condition. A NACK is indicated by leaving SDA HIGH during the clock after the last byte.

### Slave Address

Each slave device on the bus must have a unique address so the master can identify which device is sending or receiving data. The FAH4830 slave address is 0000110X binary, where "X" is the read/write bit. Master write operations are indicated when X = 0. Master read operations are indicated when X = 1.

### Writing to and Reading from the FAH4830

All read and write operations must begin with a START condition generated by the master. After the START condition, the master must immediately send a slave address (7 bits), followed by a read/write bit. If the slave address matches the address of the FAH4830, the FAH4830 sends an ACK after receiving the read/write bit by pulling the SDA line LOW for one clock cycle.

### Setting the Pointer

For all operations, a "pointer" stored in the command register must be indicating the register to be written or read. To change the pointer value in the command register, the read/write bit following the address must be 0. This indicates that the master writes new information into the command register.

After the FAH4830 sends an ACK in response to receiving the address and read/write bit, the master must transmit an appropriate 8-bit pointer value, as explained in the I²C Registers section. The FAH4830 sends an ACK after receiving the new pointer data.

The pointer-set operation is illustrated in Figure 7 and Figure 8. Any time a pointer-set is performed, it must be immediately followed by a read or write operation. The command register retains the pointer between operations; once a register is indicated, subsequent read operations do not require a pointer set cycle. Write operations always require the pointer be reset.

### Reading

If the pointer is already pointing to the desired register, the master can read from that register by setting the read/write bit (following the slave address) to 1. After sending an ACK, data transmission begins during the following clock cycle. The master should respond with a NACK, followed by a STOP condition (see Figure 5).

The master can read multiple bytes by responding to the data with an ACK instead of a NACK and continuing to send SCL pulses, as shown in Figure 6. The FAH4830 increments the pointer by one and sends the data from the next register. The master indicates the last data byte by responding with a NACK, followed by a STOP.

To read from a register other than the one currently indicated by the command register, a pointer to the desired register must be set. Immediately following the pointer-set, the master must perform a REPEAT START condition (see Figure 8), which indicates to the FAH4830 that a new operation is about to occur. If the REPEAT START condition does not occur, the FAH4830 assumes that a write is taking place and the selected register is overwritten by the upcoming data on the data bus. After the START condition, the master must again send the device address and read/write bit. This time, the read/write bit must be set to 1 to indicate a read. The rest of the read cycle is the same as described for reading from a preset pointer location.

### Writing

All writes must be preceded by a pointer set, even if the pointer is already pointing to the desired register.

Immediately following the pointer-set, the master must begin transmitting the data to be written. After transmitting each byte of data, the master must release the Serial Data (SDA) line for one clock cycle to allow the FAH4830 to acknowledge receiving the byte. The write operation should be terminated by a STOP condition from the master (see Figure 7).

As with reading, the master can write multiple bytes by continuing to send data. The FAH4830 increments the pointer by one and accepts data for the next register. The master indicates the last data byte by issuing a STOP condition.

## Applications Information

The FAH4830 has the external PWM input pin for the motor driver block. In ERM Mode, the device uses the 39 nF external capacitor as an integrator. This converts the PWM output to differential DC levels on the MDP / MDN outputs.

In the LRA Mode, to control the 10 kHz to 50 kHz frequency range of the PWM input signal; the device incorporates an internal clock-dividing feature that can be modified via the I$^2$C register settings. This allows the

user flexibility to obtain the correct resonant frequency for the chosen LRA device.

The input signal's duty cycle changes the amplitude of the positive and negative outputs for the motor drive. The LRA and ERM motor vibration strength depends on the PWM duty cycle. When the duty cycle is 50/50, the device stops. The vibration is maximum when the duty ratio is 1% to 99% or 99% to 1%. The regulator voltage level controls the amplitude of the signal at the motor.

**Figure 9.      LRA Motor Drive (MDN, MDP)**

**Figure 10.      System Block Diagram**

www.fairchildsemi.com

**Figure 11.    ERM System Block Diagram**
**Table 7.    ERM Motor Function**

**Figure 12.   LRA System Block Diagram**

**Table 8.   LRA Resonant Actuator Function**

**Note:**
5.   PWM frequency is a multiple of the LRA resonant frequency, which is controlled by $I^2C$ register control 0 bit zero and one. For example, if the LRA resonant frequency is 175 Hz, the PWM frequency would be 22.4 kHz and the $I^2C$ Divide By register would be programmed to 1/128.

## Filter and Gain Control

### Low-Pass Filter

The $C_f$ in Figure 1 (low-pass filter) is used to reduce the high-frequency harmonics caused by the PWM signal when the internal clock processing block operates. If $C_f$ is increased, the lower-frequency harmonics are reduced. If the value is decreased, the higher-frequency harmonics are decreased. Usually, 39 nF is recommended for ERM devices. Verify that the cut-off frequency is higher than the resonant frequency of the haptic device. $C_f$ Is a required component for the circuit to operate properly. The low-pass filter cut-off frequency may be determined as $f_C = 1 / (2\pi\ R_f\ C)$. At default settings and $C_f = 39$ nF, the cut-off freqency is 408 Hz.

### Gain Control

The gain of the FAH4830 is permanently set to a value of 1 with the internal resistors, at any programmable resistor value setting. If a motor requires a voltage less than is programmable with the LDO, an external resistor may be placed in parallel with capacitor $C_f$. The resultant gain is the parallel combination of external $R_f$ and Internal $R_f$, divided by the $R_i$ resistor.

## Internal LDO

The internal LDO is designed for an $I^2C$ seven-step adjustable output voltage. This provides flexibility for various motor voltages and configurations for low-power consumption. The LDO includes an internal circuit for short-circuit current protection.

## Serial Interface

On power-up, the device default values are invoked. The FAH4830 allows programming through the registers: the motor type, PWM dividing ratio, power down, and others functions. The device functions without any $I^2C$ input signals connected.

## Thermal Shutdown

The device has thermal shutdown capability. If the junction temperature is above 150°C, the temperature control block shuts down and stays off until the temperature is below 134°C. The register values are kept as written so that it's not required to initialize again.

## Over-Current Limitation

The driver includes a current-limitation block to protect against an over-current condition, mainly caused by a stuck-rotor condition. Over-current protection limitation is 500 mA typical.

## Over-Drive Motor Control for ERM

A common approach to driving DC motors is to over-drive a voltage that overcomes the inertia of the motor's mass. The motor is often overdriven for a short time before returning to the motor's rated voltage to sustain rotation. The FAN4830 haptic block can over-drive a motor up to the $V_{DD}$ voltage. Over-drive can also be used to stop (or brake) a motor quickly. The haptic driver can brake down to a voltage of GND. *Reference the motor datasheet for safe and reliable over-drive voltage and duration.* Normally, an ERM motor's rated voltage is 1.5 V, but it can be driven up to $V_{DD}$ for an over-drive condition. The over-drive function should be used during start and stop ONLY because it can damage the ERM motor if it is used for longer than the time guaranteed in the motor datasheet. The over-drive feature also helps to eliminate long vibration tails, which are undesirable in haptic feedback systems.

This function could be used in the following steps:

1. HEN = LOW

2. PWM = 90%-10% (example)

3. ORDRVEN_HL = 1 (HIGH drive)

4. ORDVEN = 1 (enabled) apply $+V_{REG}$ to motor (start)

5. HEN = 1 (enabled motor drive)

6. ORDVEN = 0 (disabled)

7. PWM = signal (example "3 clicks")

8. ORDRVEN_HL = Low

9. ORDVEN = 1 (enabled) apply $-V_{REG}$ to motor (brake)

10. HEN = 0 (disable motor drive)

11. ORDVEN = 0 (disabled)

## Over-Drive Duration

It is important that over-drive time not damage motors. The over-drive duration time must be dependent on the motor datasheet and care taken not to assert an over-voltage condition over the rated time limit of the motor.

## Status Registers

The FAH4830 has a status register set that monitors LDO input voltage, regulator output voltage, and over-temperature status.

*Package drawings are provided as a service to customers considering Fairchild components. Drawings may change in any manner without notice. Please note the revision and/or date on the drawing and contact a Fairchild Semiconductor representative to verify or obtain the most recent revision. Package specifications do not expand the terms of Fairchild's worldwide terms and conditions, specifically the warranty therein, which covers Fairchild products.*

*Always visit Fairchild Semiconductor's online packaging area for the most recent package drawings:*

## TRADEMARKS

The following includes registered and unregistered trademarks and service marks, owned by Fairchild Semiconductor and/or its global subsidiaries, and is not intended to be an exhaustive list of all such trademarks.

2Cool™
AccuPower™
AX-CAP®*
BitSiC™
Build it Now™
CorePLUS™
CorePOWER™
CROSSVOLT™
CTL™
Current Transfer Logic™
DEUXPEED®
Dual Cool™
EcoSPARK®
EfficientMax™
ESBC™
F®
Fairchild®
Fairchild Semiconductor®
FACT Quiet Series™
FACT®
FAST®
FastvCore™
FETBench™

FPS™
F-PFS™
FRFET®
Global Power Resource℠
GreenBridge™
Green FPS™
Green FPS™ e-Series™
Gmax™
GTO™
IntelliMAX™
ISOPLANAR™
Making Small Speakers Sound Louder and Better™
MegaBuck™
MICROCOUPLER™
MicroFET™
MicroPak™
MicroPak2™
MillerDrive™
MotionMax™
mWSaver™
OptoHiT™
OPTOLOGIC®
OPTOPLANAR®

®
PowerTrench®
PowerXS™
Programmable Active Droop™
QFET®
QS™
Quiet Series™
RapidConfigure™
™
Saving our world, 1mW/W/kW at a time™
SignalWise™
SmartMax™
SMART START™
Solutions for Your Success™
SPM®
STEALTH™
SuperFET®
SuperSOT™-3
SuperSOT™-6
SuperSOT™-8
SupreMOS®
SyncFET™

Sync-Lock™
SYSTEM GENERAL®*
TinyBoost™
TinyBuck™
TinyCalc™
TinyLogic®
TINYOPTO™
TinyPower™
TinyPWM™
TinyWire™
TranSiC™
TriFault Detect™
TRUECURRENT®*
μSerDes™
μSerDes™
UHC®
Ultra FRFET™
UniFET™
VCX™
VisualMax™
VoltagePlus™
XS™

* Trademarks of System General Corporation, used under license by Fairchild Semiconductor.

## DISCLAIMER
FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HEREIN TO IMPROVE RELIABILITY, FUNCTION, OR DESIGN. FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS. THESE SPECIFICATIONS DO NOT EXPAND THE TERMS OF FAIRCHILD'S WORLDWIDE TERMS AND CONDITIONS, SPECIFICALLY THE WARRANTY THEREIN, WHICH COVERS THESE PRODUCTS.

## LIFE SUPPORT POLICY
FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF FAIRCHILD SEMICONDUCTOR CORPORATION.

As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury of the user.

2. A critical component in any component of a life support, device, or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

## ANTI-COUNTERFEITING POLICY

Fairchild Semiconductor Corporation's Anti-Counterfeiting Policy. Fairchild's Anti-Counterfeiting Policy is also stated on our external website, www.fairchildsemi.com, under Sales Support.

Counterfeiting of semiconductor parts is a growing problem in the industry. All manufacturers of semiconductor products are experiencing counterfeiting of their parts. Customers who inadvertently purchase counterfeit parts experience many problems such as loss of brand reputation, substandard performance, failed applications, and increased cost of production and manufacturing delays. Fairchild is taking strong measures to protect ourselves and our customers from the proliferation of counterfeit parts. Fairchild strongly encourages customers to purchase Fairchild parts either directly from Fairchild or from Authorized Fairchild Distributors who are listed by country on our web page cited above. Products customers buy either from Fairchild directly or from Authorized Fairchild Distributors are genuine parts, have full traceability, meet Fairchild's quality standards for handling and storage and provide access to Fairchild's full range of up-to-date technical and product information. Fairchild and our Authorized Distributors will stand behind all warranties and will appropriately address any warranty issues that may arise. Fairchild will not provide any warranty coverage or other assistance for parts bought from Unauthorized Sources. Fairchild is committed to combat this global problem and encourage our customers to do their part in stopping this practice by buying direct or from authorized distributors.

## PRODUCT STATUS DEFINITIONS

### Definition of Terms

| Datasheet Identification | Product Status | Definition |
|---|---|---|
| Advance Information | Formative / In Design | Datasheet contains the design specifications for product development. Specifications may change in any manner without notice. |
| Preliminary | First Production | Datasheet contains preliminary data; supplementary data will be published at a later date. Fairchild Semiconductor reserves the right to make changes at any time without notice to improve design. |
| No Identification Needed | Full Production | Datasheet contains final specifications. Fairchild Semiconductor reserves the right to make changes at any time without notice to improve the design. |
| Obsolete | Not In Production | Datasheet contains specifications on a product that is discontinued by Fairchild Semiconductor. The datasheet is for reference information only. |
