

TPS62097 2-A High Efficiency Step-Down Converter with iDCS-Control, Forced PWM Mode and Selective Switching Frequency

1 Features

- New product available: [TPS62851x, 6-V, 0.5-A / 1-A / 2-A step-down converter in SOT583 package](#)
- iDCS-control topology
- Forced PWM or power save mode
- Up to 97% efficiency
- 2.5-V to 6.0-V input voltage
- 0.8-V to V_{IN} adjustable output voltage
- 1.8-V and 3.3-V fixed output voltage
- $\pm 1\%$ output voltage accuracy
- Hiccup short circuit protection
- Programmable soft start-up
- Output voltage tracking
- Selectable switching frequency
- 100% duty cycle for lowest dropout
- Output discharge
- Power good output
- Thermal shutdown protection
- -40°C to 125°C operating junction temperature
- Available in 2-mm \times 2-mm VQFN package

3 Description

The TPS62097 device is a synchronous step-down converter optimized for high efficiency and noise critical applications. The devices focus on high efficiency conversion over a wide output current range. At medium to heavy loads, the converter operates in PWM mode and automatically enters Power Save Mode operation at light load. The switching frequency is selectable in the range of 1.5 MHz to 2.5 MHz by an external resistor. iDCS-Control is able to be operated in forced PWM mode for low noise operation with a fixed switching frequency.

To address the requirements of system power rails, the internal compensation circuit allows a large selection of external output capacitor values in excess of 150 μF . To control the inrush current during the start-up, the device provides a programmable soft start-up by an external capacitor connected to the SS/TR pin. The SS/TR pin is also used in voltage tracking configurations. The device integrates short circuit protection, power good and thermal shutdown features. The device is available in a 2-mm \times 2-mm VQFN package.

The new product, [TPS62851x](#), offers reduced BOM cost, smaller total solution size and other features.

Table 6-1. Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
PGND	1		Power ground pin
SW	2	PWR	Switch pin. It is connected to the internal MOSFET switches. Connect the external inductor between this terminal and the output capacitor.
VOS	3	I	Output voltage sense pin. This pin must be directly connected to the output capacitor.
FB	4	I	Feedback pin. For the fixed output voltage versions, this pin is recommended to be connected to AGND for improved thermal performance. The pin also can be left floating as an internal 400-kΩ resistor is connected between this pin and AGND for fixed output voltage versions. For the adjustable output voltage version, a resistor divider sets the output voltage.
PG	5	O	Power-good open-drain output pin. The pullup resistor should not be connected to any voltage higher than 6 V. If it is not used, leave the pin floating.
EN	6	I	Enable pin. To enable the device, this pin needs to be pulled high. Pulling this pin low disables the device. This pin has an internal pulldown resistor of typically 375 kΩ when the device is disabled.
PVIN	7	PWR	Power input supply pin
AVIN	8	I	Analog input supply pin. Connect it to the PVIN pin together.
SS/TR	9	I	Soft start-up and voltage tracking pin. A capacitor is connected to this pin to set the soft start-up time. Leaving this pin floating sets the minimum start-up time.
MODE	10	I	Mode selection pin. Connect this pin to AGND to enable Power Save Mode with automatic transition between PWM and Power Save Mode. Connect this pin to an external resistor or leave floating to enable forced PWM mode only. See Table 8-1 .

7.6 Typical Characteristics

8 Detailed Description

8.1 Overview

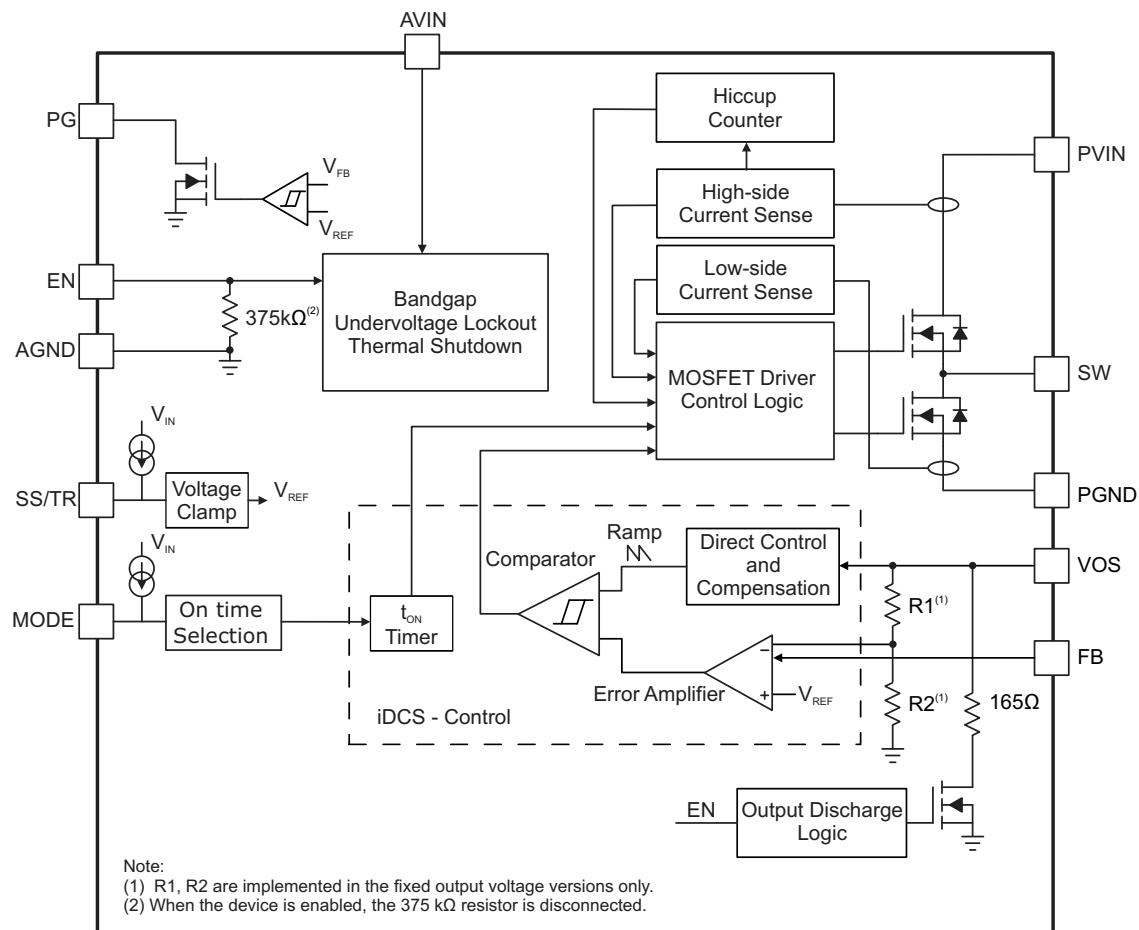

The TPS62097 synchronous step-down converter is based on the iDCS-Control (Industrial Direct Control with Seamless transition into Power Save Mode) topology. The control topology not only keeps the advantages of DCS-Control, but also provides other features:

- Forced PWM mode over the whole load range
- Selectable PWM switching frequency
- 1% output voltage accuracy
- Output voltage sequencing and tracking

The iDCS-Control topology operates in PWM (Pulse Width Modulation) mode for medium to heavy load conditions and in Power Save Mode (PSM) at light load conditions. Or it forces the device in fixed frequency PWM mode only operation for the whole load range.

In PWM mode, the device operates with a predictive on-time switching pulse. A quasi-fixed switching frequency over the input and output voltage range is achieved by using an input and output voltage feedforward to set the on-time, as shown in Table 8-1. The converter enters Power Save Mode, reducing the switching frequency and minimizing current consumption, to achieve high efficiency over the entire load current range. Since iDCS-Control supports both operation modes within a single building block, the transition from PWM mode to Power Save Mode is seamless and without effects on the output voltage.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 100% Duty Cycle Mode

The device offers a low input to output voltage dropout by entering 100% duty cycle mode when the input voltage reaches the level of the output voltage. In this mode, the high-side MOSFET switch is constantly turned on and the low-side MOSFET is switched off. The minimum input voltage to maintain output regulation, depending on the load current and output voltage, is calculated as:

$$V_{IN(min)} = V_{OUT(min)} + I_{OUT} \times (R_{DS(on)} + R_L) \quad (1)$$

where

- $V_{IN(min)}$ = Minimum input voltage to maintain a minimum output voltage
- I_{OUT} = Output current
- $R_{DS(on)}$ = High side FET on-resistance
- R_L = Inductor ohmic resistance (DCR)

When the device operates close to 100% duty cycle mode, the TPS62097 cannot enter Power Save Mode regardless of the load current if the input voltage decreases to typically 15% above the output voltage. The device maintains output regulation in PWM mode.

8.3.2 Switch Current Limit and Hiccup Short Circuit Protection

The switch current limit prevents the devices from high inductor current and from drawing excessive current from the battery or input voltage rail. Excessive current might occur with a shorted/saturated inductor or a heavy load/shorted output circuit condition. If the inductor current reaches the threshold I_{LIMF} , the high-side MOSFET is turned off and the low-side MOSFET is turned on to ramp down the inductor current. Once this switch current limit is triggered 32 times, the devices stop switching and enable the output discharge. The devices then automatically start a new start-up after a typical delay time of 100 μ s has passed. This is HICCUP short circuit protection and is implemented to reduce the current drawn during a short circuit condition. The devices repeat this mode until the high load condition disappears.

When the device is in forced PWM mode, the negative current limit of the low-side MOSFET is active. The negative current limit prevents excessive current from flowing back through the inductor to the input.

8.3.3 Undervoltage Lockout (UVLO)

To avoid mis-operation of the device at low input voltages, an undervoltage lockout is implemented, which shuts down the devices at voltages lower than V_{UVLO} with a hysteresis of 100 mV.

8.3.4 Thermal Shutdown

The device goes into thermal shutdown and stops switching once the junction temperature exceeds T_{JSD} . Once the device temperature falls below the threshold by 20°C, the device returns to normal operation automatically.

8.4 Device Function Modes

8.4.1 Enable and Disable (EN)

The device is enabled by setting the EN pin to a logic high. Accordingly, shutdown mode is forced if the EN pin is pulled low with a shutdown current of typically 0.7 μ A.

In shutdown mode, the internal power switches as well as the entire control circuitry are turned off. An internal resistor of 165 Ω discharges the output through the VOS pin smoothly. The output discharge function also works when thermal shutdown, undervoltage lockout, or HICCUP short circuit protection are triggered.

An internal pulldown resistor of 375 k Ω is connected to the EN pin when the EN pin is low. The pulldown resistor is disconnected when the EN pin is high.

8.4.2 Power Save Mode and Forced PWM Mode (MODE)

The MODE pin is a multi-functional pin that allows the device operation in forced PWM mode or PWM/PSM mode, and to select the PWM switching frequency.

Once the EN pin is pulled high, the IC enables internal circuit blocks and prepares to ramp the output up. The period between the rising edge of the EN pin and the beginning of the power stage switching is called the MODE detection time, typically 50 μs. During the MODE detection time period, shown in Figure 8-1, the PWM switching frequency and operating mode are set by the MODE pin status, as shown in Table 8-1.

The PWM switching frequency cannot be changed after the detection time period. Only when the device is set in PWM/PSM mode during the MODE detection time period (MODE = AGND), it is possible to switch between PWM/PSM and forced PWM operation modes by toggling the MODE pin with a GPIO pin of a microcontroller, for example. The other four MODE pin selections force the device in PWM mode only.

Figure 8-1. Power-up Sequence

Table 8-1. Switching Frequency and Mode Selection

TYPICAL PWM SWITCHING FREQUENCY (MHZ)	RESISTANCE AT MODE PIN (E24 EIA VALUE)	TOGGLE MODE PIN AFTER MODE DETECTION	ON-TIME EQUATION	OPERATING MODE
1.50	8.2 kΩ ±5%	No	$t_{ON} = 667 \text{ ns} \times V_{OUT} / V_{IN}$	Forced PWM
1.75	18 kΩ ±5%	No	$t_{ON} = 571 \text{ ns} \times V_{OUT} / V_{IN}$	Forced PWM
2.00	AGND	Yes	$t_{ON} = 500 \text{ ns} \times V_{OUT} / V_{IN}$	PWM/PSM and Forced PWM
2.25	39 kΩ ±5%	No	$t_{ON} = 444 \text{ ns} \times V_{OUT} / V_{IN}$	Forced PWM
2.50	75 kΩ ±5% or Open	No	$t_{ON} = 400 \text{ ns} \times V_{OUT} / V_{IN}$	Forced PWM

Connecting the MODE pin to AGND with a resistor or leaving the MODE pin open forces the device into PWM mode for the whole load range. The device operates with a fixed switching frequency that allows simple filtering of the switching frequency for noise sensitive applications. In forced PWM mode, the efficiency is lower than that of PSM at light load.

Connecting the MODE pin to the AGND pin enables Power Save Mode with an automatic transition between PWM and Power Save Mode. As the load current decreases and the inductor current becomes discontinuous, the device enters Power Save Mode operation automatically. In Power Save Mode, the switching frequency is reduced and estimated by Equation 2. In Power Save Mode, the output voltage rises slightly above the nominal output voltage, as shown in Figure 9-8. This effect is minimized by increasing the output capacitor.

$$f_{PSM} = \frac{2 \times I_{OUT}}{t_{ON}^2 \times \frac{V_{IN}}{V_{OUT}} \times \frac{V_{IN} - V_{OUT}}{L}} \quad (2)$$

When the device operates close to 100% duty cycle mode, the TPS62097 cannot enter Power Save Mode regardless of the load current if the input voltage decreases to typically 15% above the output voltage. The device maintains output regulation in PWM mode.

8.4.3 Soft Start-up (SS/TR)

The TPS62097 programs its output voltage ramp rate with the SS/TR pin. Connecting an external capacitor to SS/TR enables output soft start-up to reduce inrush current from the input supply. The device charges the capacitor voltage to the input supply voltage with a constant current of typically 7.5 μA . The FB pin voltage follows the SS/TR pin voltage until the internal reference voltage of 0.8 V is reached. The soft start-up time is calculated using Equation 3. Keep the SS/TR pin floating to set the minimum start-up time.

$$t_{\text{SS}} = C_{\text{SS/TR}} \times \frac{0.8\text{V}}{7.5\mu\text{A}} \quad (3)$$

An active pull-down circuit is connected to the SS/TR pin. It discharges the external soft start-up capacitor in case of disable, UVLO, thermal shutdown, and HICCUP short circuit protection.

8.4.4 Voltage Tracking (SS/TR)

The SS/TR pin is externally driven by another voltage source to achieve output voltage tracking. The application circuit is shown in Figure 8-2. From 0 V to 0.8 V, the internal reference voltage to the internal error amplifier follows the SS/TR pin voltage. When the SS/TR pin voltage is above 0.8 V, the voltage tracking is disabled and the FB pin voltage is regulated at 0.8 V. The device achieves ratiometric or coincidental (simultaneous) output tracking, as shown in Figure 8-3.

Figure 8-2. Output Voltage Tracking

Figure 8-3. Voltage Tracking Options

The R2 value should be set properly to achieve accurate voltage tracking by taking 7.5 μA soft start-up current into account. 1 k Ω or smaller is a sufficient value for R2.

For decreasing SS/TR pin voltage, the device does not sink current from the output when the device is in PSM, so the resulting decreases of the output voltage can be slower than the SS/TR pin voltage if the load is light. When driving the SS/TR pin with an external voltage, do not exceed the voltage rating of the SS/TR pin which is $V_{\text{IN}} + 0.3\text{V}$.

8.4.5 Power Good (PG)

The TPS62097 has a power-good output. The PG pin goes high impedance once the output voltage is above 95% of the nominal voltage and is driven low once the output voltage falls below typically 90% of the nominal voltage. The PG pin is an open-drain output and is specified to sink up to 1 mA. The power-good output requires a pullup resistor connected to any voltage rail less than 6 V. The PG pin goes low when the device is disabled or in thermal shutdown. When the devices are in UVLO, the PG pin is high impedance.

The PG signal can be used for sequencing of multiple rails by connecting it to the EN pin of other converters. Leave the PG pin floating when not used.

9 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1 Application Information

The following section discusses the design of the external components to complete the power supply design of the TPS62097.

R2	20 kΩ, 1% accuracy	Std
R3	100 Ωk, 1% accuracy	Std

9.2.2 Detailed Design Procedure

9.2.2.1 Setting the Output Voltage

The output voltage is set by an external resistor divider according to [Equation 4](#):

$$V_{OUT} = V_{FB} \times \left(1 + \frac{R1}{R2}\right) = 0.8 \text{ V} \times \left(1 + \frac{R1}{R2}\right) \quad (4)$$

R2 should not be higher than 20 kΩ to reduce noise coupling into the FB pin and improve the output voltage regulation. [Figure 9-1](#) shows the external resistor divider value for 1.2-V output. Choose additional resistor values for other outputs. A feedforward capacitor is not required.

The fixed output voltage versions, TPS6209718 and TPS6209733, do not need the external resistor divider. TI recommends to connect the FB pin to AGND for improved thermal performance.

9.2.2.2 Output Filter Design

The inductor and the output capacitor together provide a low-pass filter. To simplify the selection process, [Table 9-3](#) outlines possible inductor and capacitor value combinations for most applications.

Table 9-3. Output Capacitor / Inductor Combinations

NOMINAL L [μH] ⁽²⁾	NOMINAL C _{OUT} [μF] ⁽³⁾				
	10	22	47	100	150
0.47					
1		+(1)	+	+	+
2.2					

- (1) Typical application configuration. Other '+' mark indicates recommended filter combinations. Other values may be acceptable in applications but should be fully tested by the user. Refer to the application note [SLVA710](#).
- (2) Inductor tolerance and current de-rating is anticipated. The effective inductance can vary by +20% and -30%. The required effective inductance is 500-nH minimum.
- (3) Capacitance tolerance and bias voltage de-rating is anticipated. The effective capacitance can vary by 20% and -50%.

9.2.2.3 Inductor Selection

The main parameters for the inductor selection are the inductor value and the saturation current. To calculate the maximum inductor current under static load conditions, [Equation 5](#) is given.

$$I_{L,MAX} = I_{OUT,MAX} + \frac{\Delta I_L}{2}$$

$$\Delta I_L = V_{OUT} \times \frac{1 - \frac{V_{OUT}}{V_{IN}}}{L \times f_{SW}} \quad (5)$$

Where:

$I_{OUT,MAX}$ = Maximum output current
 ΔI_L = Inductor current ripple
 f_{SW} = Switching frequency
 L = Inductor value

TI recommends to choose the saturation current for the inductor 20% to 30% higher than the $I_{L,MAX}$, out of [Equation 5](#). A higher inductor value is also useful to lower ripple current but increases the transient response time as well. The following inductors are recommended to be used in designs.

9.2.2.4 Capacitor Selection

The input capacitor is the low impedance energy source for the converters which helps to provide stable operation. A low-ESR multilayer ceramic capacitor is required for best filtering and should be placed between PVIN and PGND as close as possible to those pins. For most applications, a 10- μ F capacitor is sufficient, though a larger value reduces input current ripple.

The architecture of the TPS62097 allows the use of tiny ceramic output capacitors with low equivalent series resistance (ESR). These capacitors provide low output voltage ripple and are recommended. To keep its low resistance up to high frequencies and to get narrow capacitance variation with temperature, TI recommends to use X7R or X5R dielectrics. The recommended typical output capacitor value is 22 μ F and can vary over a wide range as outlined in [Table 9-4](#).

Ceramic capacitors have a DC-Bias effect, which has a strong influence on the final effective capacitance. Choose the right capacitor carefully in combination with considering its package size and voltage rating. Ensure that the input effective capacitance is at least 5 μ F and the output effective capacitance is at least 10 μ F.

9.2.4.1 Design Requirements

For this design example, use the following as the input parameters.

Table 9-5. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Input voltage range	2.5 V to 6 V
Output voltage 1	1.8 V
Output voltage 2	1.2 V
Output voltage 2 follows output voltage 1 coincidentally.	

9.2.4.2 Detailed Design Procedure

Set 1 kΩ for R2 and 0.5 kΩ for R1. Connect the two converters as shown in Figure 9-22. Set up two converters in forced PWM mode.

9.2.4.3 Application Performance Curve

$T_A = 25^\circ\text{C}$, $V_{IN} = 5.0\text{ V}$, unless otherwise noted.

9.2.5.1 Design Requirements

For this design example, use the following as the input parameters.

Table 9-6. Design Parameters

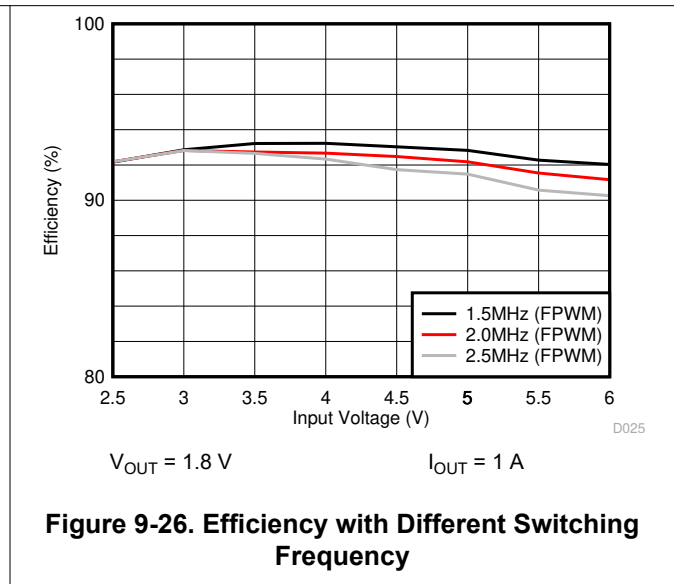

DESIGN PARAMETER	EXAMPLE VALUE
Input voltage range	2.5 V to 6 V
Output voltage 1	1.8 V
Switching Frequency Selection	1.5 MHz, 2.0 MHz, or 2.5 MHz

9.2.5.2 Detailed Design Procedure

Set 8.2 kΩ and 75 kΩ for 1.5-MHz, 2.0-MHz, and 2.5-MHz switching frequency. R4 uses the standard E24 series resistor values.

9.2.5.3 Application Performance Curves

$T_A = 25^\circ\text{C}$, $V_{IN} = 5.0$, unless otherwise noted.

10 Power Supply Recommendations

The devices are designed to operate from an input voltage supply range between 2.5 V and 6 V. The average input current of the TPS62097 is calculated as:

$$I_{IN} = \frac{1}{\eta} \times \frac{V_{OUT} \times I_{OUT}}{V_{IN}} \quad (6)$$

Ensure that a power supply has a sufficient current rating for the application.

11 Layout

11.1 Layout Guidelines

- TI recommends to place all components as close as possible to the IC. Specifically, the input capacitor placement must be closest to the PVIN and PGND pins of the device.
- The low side of the input and output capacitors must be connected directly to the PGND pin to avoid a ground potential shift.
- Use the terminal of the input capacitor as the common node for AVIN and PVIN, AGND, and PGND. It helps reduce the noise coupling into the internal analog circuit blocks. Do not use a solid plane pour to connect these nodes.
- Use wide and short traces for the main current paths to reduce the parasitic inductance and resistance.
- The sense trace connected to VOS pin is a signal trace. Special care should be taken to avoid noise being induced. By a direct routing, parasitic inductance can be kept small. Keep the trace away from SW nodes.
- Refer to the [Figure 11-1](#) for an example of component placement, routing, and thermal design.

11.2 Layout Example

Figure 11-1. TPS62097 PCB Layout

11.2.1 Thermal Information

Implementation of integrated circuits in low-profile and fine pitch surface mount packages typically requires special attention to power dissipation. Many system dependent issues such as thermal coupling, airflow, added heat sinks and convection surfaces, and the presence of other heat-generating components affect the power-dissipation limits of a given component.

[Section 7.4](#) provides the thermal metric of the device on the TPS62097 EVM after considering the PCB design of real applications. The big copper planes connecting to the pads of the IC on the PCB board improve the thermal performance of the device. For more details on how to use the thermal parameters, see the application notes: Thermal Characteristics Application Notes [SZZA017](#) and [SPRA953](#).

12 Device and Documentation Support

12.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
