## 2. Pin Description

Table 2.1 Pin Description

Pin Name	Description
I/O0 - I/O7	<b>Inputs/Outputs.</b> The I/O pins are used for command input, address input, data input, and data output. The I/O pins float to High-Z when the device is deselected or the outputs are disabled.
CLE	<b>Command Latch Enable.</b> This input activates the latching of the I/O inputs inside the Command Register on the rising edge of Write Enable (WE#).
ALE	<b>Address Latch Enable.</b> This input activates the latching of the I/O inputs inside the Address Register on the rising edge of Write Enable (WE#).
CE#	<b>Chip Enable.</b> This input controls the selection of the device. When the device is not busy CE# low selects the memory.
WE#	<b>Write Enable.</b> This input latches Command, Address and Data. The I/O inputs are latched on the rising edge of WE#.
RE#	<b>Read Enable.</b> The RE# input is the serial data-out control, and when active drives the data onto the I/O bus. Data is valid $t_{REA}$ after the falling edge of RE# which also increments the internal column address counter by one.
WP#	<b>Write Protect.</b> The WP# pin, when low, provides hardware protection against undesired data modification (program / erase).
R/B#	<b>Ready Busy.</b> The Ready/Busy output is an Open Drain pin that signals the state of the memory.
VCC	<b>Supply Voltage.</b> The $V_{CC}$ supplies the power for all the operations (Read, Program, Erase). An internal lock circuit prevents the insertion of Commands when $V_{CC}$ is less than $V_{LKO}$ .
VSS	<b>Ground.</b>
NC	<b>Not Connected.</b>

**Notes:**

1. A 0.1  $\mu$ F capacitor should be connected between the  $V_{CC}$  Supply Voltage pin and the  $V_{SS}$  Ground pin to decouple the current surges from the power supply. The PCB track widths must be sufficient to carry the currents required during program and erase operations.
2. An internal voltage detector disables all functions whenever  $V_{CC}$  is below 1.8V to protect the device from any involuntary program/erase during power transitions.

5th / Row Add. 3 (6)	A28 (BA9)	A29 (BA10)	A30 (BA11)	Low	Low	Low	Low	Low

**Notes:**

1. CAx = Column Address bit.
2. PAx = Page Address bit.
3. PLA0 = Plane Address bit zero.
4. BAx = Block Address bit.
5. Block address concatenated with page address and plane address = actual page address, also known as the row address.
6. A30 for 8 Gb (4 Gb x 2 – DDP) (1CE).

For the address bits, the following rules apply:

- A0 - A11: column address in the page
- A12 - A17: page address in the block
- A18: plane address (for multiplane operations) / block address (for normal operations)

- A19 - A30: block address

## 5. Read Status Enhanced

Read Status Enhanced is used to retrieve the status value for a previous operation in the following cases:

- In the case of concurrent operations on a multi-die stack.

When two dies are stacked to form a dual-die package (DDP), it is possible to run one operation on the first die, then activate a different operation on the second die, for example: Erase while Read, Read while Program, etc.

- In the case of multiplane operations in the same die.

## 6. Extended Read Status

Multi-die stack devices support the Extended Read Status operation. When two operations are active in separate dies at the same time, this feature allows the host to check the status of a given die. For example, the first die could be executing a Page Program while the second die is performing a Page Read. Refer to [Table 6.1](#) for a description of each command.

**Table 6.1** Extended Read Status

Command	Die	Row Address with 4 Gb Dies
F2h	First	0 to 3FFFFh
F3h	Second	40000h to 7FFFFh

## 7. Read ID

The device contains a product identification mode, initiated by writing 90h to the command register, followed by an address input of 00h.

**Note:** If you want to execute Read Status command (0x70) after Read ID sequence, you should input dummy command (0x00) before Read Status command (0x70).

For the S34ML04G1 device, five read cycles sequentially output the manufacturer code (01h), and the device code and 3rd, 4th, and 5th cycle ID, respectively. The command register remains in Read ID mode until further commands are issued to it.

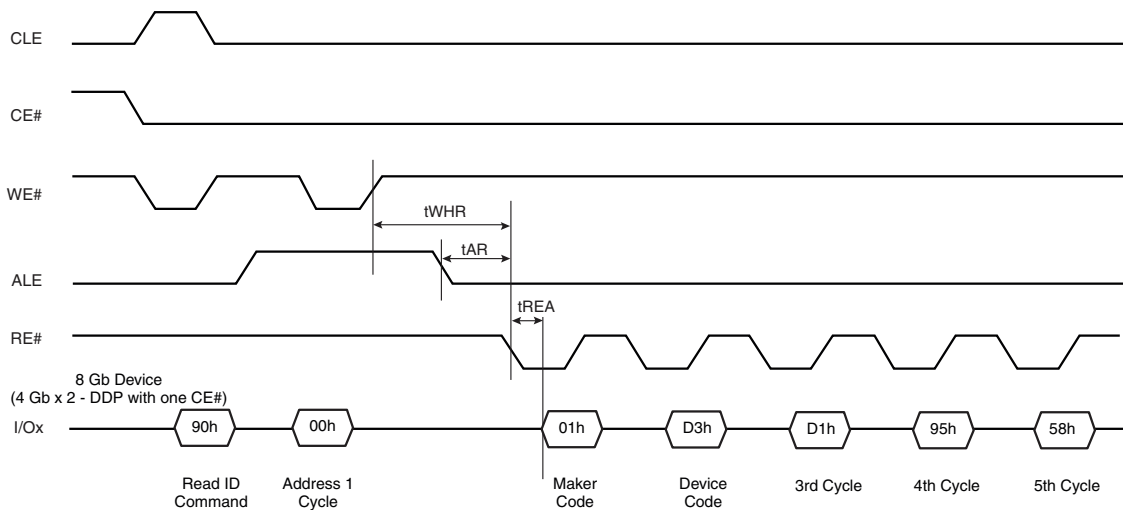

**Table 7.1** Read ID for Supported Configurations (1)

Density	Org	V <sub>CC</sub>	1st	2nd	3rd	4th	5th
4 Gb	x8	3.3V	01h	DCh	90h	95h	54h
8 Gb (4 Gb x 2 – DDP with two CE#)	x8	3.3V	01h	DCh	90h	95h	54h
8 Gb (4 Gb x 2 – DDP with one CE#) (1)	x8	3.3V	01h	D3h	D1h	95h	58h

**Note:**

- All current measurements are performed with a 0.1  $\mu\text{F}$  capacitor connected between the  $V_{CC}$  Supply Voltage pin and the  $V_{SS}$  Ground pin.
- Standby current measurement can be performed after the device has completed the initialization process at power-up.

**Note:**

- For the stacked devices version the Input is 10 pF x [number of stacked chips] and the Input/Output is 10 pF x [number of stacked chips].

## 8.4 Power Consumptions and Pin Capacitance for Allowed Stacking Configurations

When multiple dies are stacked in the same package, the power consumption of the stack will increase according to the number of chips. As an example, the standby current is the sum of the standby currents of all the chips, while the active power consumption depends on the number of chips concurrently executing different operations.

When multiple dies are stacked in the same package the pin/ball capacitance for the single input and the single input/output of the combo package must be calculated based on the number of chips sharing that input or that pin/ball.

## 11. Appendix A — Errata

For Cypress NAND MCPs (Multi-Chip Package) like the 8 Gb (2 x 4 Gb), due to the internal bonding, READ ID automatically changes to the hard-wired values and currently there is no way to change it electrically. Therefore, the Cypress NAND 8 Gb with one CE# will not follow the same methodology of READ ID as SDPs (Single Die Package). The READ ID values for the 8-Gb Cypress NAND with one CE# will be as follows:

1st Byte: 01h

2nd Byte: D3h

3rd Byte: D1h

4th Byte: 95h

5th Byte: 58h

	1st Byte	2nd Byte	3rd Byte	4th Byte	5th Byte
8 Gb with one CE# (Currently with error)	01h	D3h	D1h	95h	58h
8 Gb with one CE# (Cypress methodology)	01h	DCh	91h	95h	54h

Currently, Cypress does not plan to fix the problem. If there are any issues related to this, please contact Cypress NAND Product Marketing for further questions.
