

# MAX3671 Evaluation Kit

## General Description

The MAX3671 evaluation kit (EV kit) is a fully assembled and tested demonstration board that simplifies evaluation of the MAX3671 low-jitter frequency synthesizer with selectable input reference. The EV kit includes slide switches to allow easy selection of different modes of operation. Clock I/Os have SMA connectors and are AC-coupled to simplify connection to test equipment. The EV kit is powered by a +3.3V supply and uses LEDs for signal status indicators.

## Features

- ◆ Fully Assembled and Tested
- ◆ Slide Switches for Mode Control
- ◆ SMA Connectors and AC-Coupled Clock I/Os
- ◆ Powered by +3.3V Supply
- ◆ LED Signal Status Indicators

## Quick Start

- Set the slide switches to the following settings:  
 PLL\_BYPASS = NORMAL  
 SEL\_CLK = REFCLK0  
 DM = 62.5M  
 DA = 125M  
 DB = 125M  
 $\overline{\text{OUTA\_EN}}$  = A0, A1  
 $\overline{\text{OUTB\_EN}}$  = B0  
 FB\_SEL = INTERNAL
- Connect a +3.3V supply to VCC (J13) and GND (J4). Set the supply current limit to 450mA.
- Using SMA cables, connect a low-jitter 62.5MHz differential clock source to the REFCLK0 input. Verify that the green LEDs switch on for  $\overline{\text{IN0FAIL}}$  and LOCK.
- Using SMA cables, connect the OUTA0 output to test equipment. Terminate all unused enabled outputs ( $\overline{\text{OUTB0}}$  and OUTA1).

## Detailed Description

The MAX3671 EV kit simplifies evaluation by providing the hardware needed to evaluate all the MAX3671 functions. Table 1 contains functional descriptions for the switches and indicators.

### Clock Inputs

The clock inputs (REFCLK0, REFCLK1, FB\_IN) are AC-coupled at the SMA connectors and have on-board 100 $\Omega$  differential terminations. For optimal jitter performance it is critical to use a low-jitter, differential, square-wave clock source. If such a source is not available, the clock inputs can be driven with a single-ended sinusoidal or square-wave clock source for functional testing.

### Clock Outputs

The clock outputs (OUTA[3:0], OUTB[4:0]) have on-board DC-biasing and are AC-coupled at the SMA connectors to allow direct connection to 50 $\Omega$ -terminated test equipment. Unused outputs should be disabled (using switches S9 and S10) or have 50 $\Omega$  terminations placed on the SMA connectors.

**Table 1. Switch and Indicator Descriptions**

COMPONENT	NAME	FUNCTION
S1	MASTER RESET	Momentary switch to reset internal dividers. Not required at power-up. If the output divider settings (DA, DB) are changed on the fly, a reset is required to phase align the outputs.
S2	PLL_BYPASS	Selects normal PLL operation or PLL bypass.
S3	SEL_CLK	Selects the reference clock input.
S5	FB_SEL	Selects internal or external feedback for the PLL. If external is selected, connect any of the A-group or B-group outputs to the FB_IN input. If DA $\neq$ DB, a B-group output must be used.
S6	DM	Selects the frequency of the reference clock inputs.
S7	DA	Selects the frequency of the A-group clock outputs.
S8	DB	Selects the frequency of the B-group clock outputs.
S9	$\overline{\text{OUTA\_EN}}$	Selects which A-group outputs are enabled (see Note).
S10	$\overline{\text{OUTB\_EN}}$	Selects which B-group outputs are enabled (see Note).
D1, D2	$\overline{\text{IN0FAIL}}$	REFCLK0 failure indicator (green = pass, red = fail).
D3, D4	$\overline{\text{IN1FAIL}}$	REFCLK1 failure indicator (green = pass, red = fail).
D7, D8	LOCK	PLL lock indicator (green = PLL locked, red = PLL not locked).

**Note:** Setting  $\overline{\text{OUTA\_EN}}$  = "—" and  $\overline{\text{OUTB\_EN}}$  = "B0" at the same time enables a factory test mode and is not a valid mode of operation.
