

## 0.5 dB LSB GaAs MMIC 5-BIT DIGITAL ATTENUATOR, 0.1 - 30 GHz

### Typical Applications

The HMC1019LP4E is ideal for:

- Fiber Optics & Broadband Telecom
- Microwave Radio & VSAT
- Military Radios, Radar & ECM
- Space Applications
- Sensors
- Test & Measurement Equipment

### Features

- 0.5 dB LSB Steps to 15.5 dB
- TTL/CMOS Compatible, Serial Control
- Unique Asynchronous Mode Control Allows Immediate Attenuation Level Setting
- ±0.5 dB Typical Bit Error
- High Input IP3: +45 dBm
- 24 Lead 4x4mm SMT Package: 16mm<sup>2</sup>

### Functional Diagram

### General Description

The HMC1019LP4E is a broadband 5-bit GaAs IC digital attenuator in a low cost leadless surface mount package. Covering 0.1 to 30.0 GHz, the insertion loss is less than 4.0 dB typical. The attenuator bit values are 0.5 (LSB), 1, 2, 4, 8 for a total attenuation of 15.5 dB. Attenuation accuracy is excellent at ±0.3 dB typical step error with an IIP3 of +45 dBm. The control interface is CMOS/TTL compatible and accepts a three wire serial input. The HMC1019LP4E features a user selectable power up state and a serial-output port for cascading other Hittite serial controlled components.

## Serial Control Interface

## 0.5 dB LSB GaAs MMIC 5-BIT DIGITAL ATTENUATOR, 0.1 - 30 GHz

The HMC1019LP4E contains a 3-wire SPI compatible digital interface (SERIN, CLK, LE). The serial control interface is activated when S/A is kept high. The 5-bit serial word must be loaded MSB first as a 6-bit word with the first bit ignored. The positive-edge sensitive CLK and LE requires clean transitions. If mechanical switches are used, sufficient debouncing should be provided. When LE is high, 5-bit data in the serial input register is transferred to the attenuator. When LE is high CLK is masked to prevent data transition during output loading.

For all modes of operations, the state will stay constant while LE is kept low.

### Serial Mode Truth Table

Control Voltage Input					Attenuation State
P4	P3	P2	P1	P0	RF1 - RF2
8 dB	4 dB	2 dB	1 dB	0.5 dB	Reference I.L.
High	High	High	High	High	Reference I.L.
High	High	High	High	Low	0.5 dB
High	High	High	Low	High	1 dB
High	High	Low	High	High	2 dB
High	Low	High	High	High	4 dB
Low	High	High	High	High	8 dB
Low	Low	Low	Low	Low	15.5 dB

Any combination of the above states will provide an attenuation approximately equal to the sum of the bits selected.

Parameter	Typ.
Min. serial period, $t_{SCK}$	100 ns
Control set-up time, $t_{CS}$	20 ns
Control hold-time, $t_{CH}$	20 ns
LE setup-time, $t_{LN}$	10 ns
Min. LE pulse width, $t_{LEW}$	10 ns
Min LE pulse spacing, $t_{LES}$	630 ns
Serial clock hold-time from LE, $t_{CKN}$	10 ns
Hold Time, $t_{PH}$	0 ns
Latch Enable Minimum Width, $t_{LEN}$	10 ns
Setup Time, $t_{PS}$	2 ns

### Asynchronous Mode

The HMC1019LP4E can be switched to an asynchronous mode to change the attenuation state rapidly to one of four predefined states. The logic state of ASM1-ASM2 determines one of the four attenuation states in the asynchronous mode per truth table. The asynchronous mode works either directly or latched. To activate the direct-asynchronous-mode, S/A needs to be at logic low and LE needs to be at logic high. In the direct-asynchronous-mode, any change in the logic state of ASM1-ASM2 directly affects the attenuation state. In the latched-asynchronous-mode, the attenuation state changes per the asynchronous mode truth table when S/A is at logic low and LE is pulsed per the timing diagram. The attenuation stays constant (latched) as long as LE stays low. In the asynchronous mode, the inputs SERIN and CLK do not affect the attenuation state.

**Timing Diagram (Latched Asynchronous Mode)**

**0.5 dB LSB GaAs MMIC 5-BIT DIGITAL

**Asynchronous Mode Truth Table**

ASM1	ASM2	Attenuation State RF1-RF2
High	High	Reference I.L.
High	Low	1.5 dB
Low	High	14 dB
Low	Low	15.5 dB

**Power-Up States**

If LE is set to logic LOW at power-up, the logic state of PUP determines the power-up state of the part per PUP truth table. If the LE is set to logic HIGH at power-up, the logic state of ASM1-ASM2 determines the power-up state of the part per truth table for the asynchronous mode. The attenuator latches in the desired power-up state approximately 200 ms after power-up.

**PUP Truth Table**

PUP	Attenuation State
High	Reference I.L.
Low	15.5 dB

Note: The logic state of ASM1-ASM2 determines the power-up state of the part per truth table for the asynchronous mode when LE is high at power-up.

[2] Circuit Board Material: Rogers 4350

The circuit board used in the application should use RF circuit design techniques. Signal lines should have 50 Ohm impedance while the package ground leads should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation circuit board shown is available from Hittite upon request.
