Description

The PI6C4511 is a high-performance frequency multiplier, that integrates analog Phase Lock Loop (PLL).

The PI6C4511 is the most cost effective way to generate a high-quality, high-frequency clock output from a crystal input or clock input. It is designed to replace crystal oscillators in electronic systems, or to be used as clock multiplier and frequency translation.

The complex logic divider generates nine different popular multiplication factors, allowing the device to produce output of many common frequencies.

The device also has an Output Enable pin that tri-states the clock output. The PI6C4511 is intended for applications that needed clock generation and frequency translation with low output jitter.
