

## LDO with Reverse Current Protection / Soft Start / Discharge Function

### ■ GENERAL DESCRIPTION

The NJM12856 is a low dropout regulator which achieves high ripple rejection, low noise and high speed response with the bipolar technology.

Adjustable soft-start function is useful for reducing inrush current and controlling power-on sequence. Moreover the discharge function makes effective sequence control with the soft-start function.

In addition, the reverse current protection makes external SBD unnecessary.

### ■ FEATURE

- Operating Voltage Range    2.5V ~ 6.5V
- Output Voltage Accuracy     $V_O \pm 1.0\%$
- Output Current                 $I_O(\text{min.})=1000\text{mA}$
- Reverse Current Protection
- Adjustable soft-start Function
- Discharge Function
- ON/OFF Control
- Correspond to Low ESR capacitor (MLCC)
- Thermal Shutdown Circuit
- Over Current Protection Circuit
- Package Outline                SOT-89-5, TO-252-5

## ■ TYPICAL APPLICATION

1. In the case where ON/OFF Control is not required

Connect CONTROL Pin to  $V_{IN}$  Pin

2. In use of ON/OFF CONTROL

State of CONTROL Pin:

“H” → output is enabled.

“L” or “open” → output is disabled

## \*Reverse Current Protection

The NJM12856 has built-in Reverse Current Protection circuit.

This circuit prevents the large reverse current when output voltage is higher than input voltage.

Therefore external schottky-barrier diode(SBD) is not required

## \*Soft Start capacitor Cs

The Soft Start function can control the rise time of Output Voltage and reduce the inrush current by connecting the Cs capacitor.

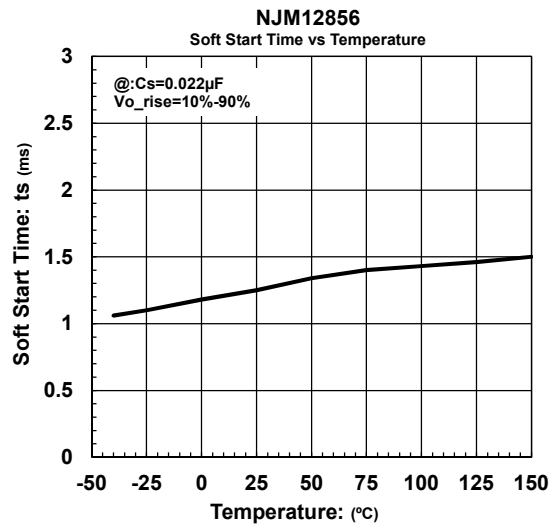

The Soft Start time is defined as 10% to 90% of the Output Voltage.

The Cs capacitor is not essential, but it used for noise bypass of bandgap reference either. Therefore Output Noise Voltage increases when the capacitor isn't connected.

If the Cs capacitor is not used, the Cs Pin should be OPEN.

## \*Discharge Function

The NJM12856 has a built-in discharge circuit to discharge the charged output capacitors.

Discharge circuit operates when the CONTROL Pin is set in LOW level. The circuit discharges the charged output capacitors rapidly.

Output Voltage sweep down characteristics by Discharge function

## \*Input Capacitor $C_{IN}$

The input capacitor  $C_{IN}$  is required to prevent oscillation and reduce power supply ripple for applications when high power supply impedance or a long power supply line.

Therefore, use the recommended  $C_{IN}$  value (refer to conditions of ELECTRIC CHARACTERISTIC) or larger and should connect between GND and  $V_{IN}$  as shortest path as possible to avoid the problem.

## \*Output Capacitor $C_O$

The output capacitor  $C_O$  will be required for a phase compensation of the internal error amplifier.

The capacitance and the equivalent series resistance (ESR) influence to stable operation of the regulator.

Use of a smaller  $C_O$  may cause excess an output noise or an oscillation of the regulator due to lack of the phase compensation.

On the other hand, use of a larger  $C_O$  reduces an output noise and a ripple output, and also improves an output transient response when a load rapidly changes.

Therefore, use the recommended  $C_O$  value (refer to conditions of ELECTRIC CHARACTERISTIC) or larger and should connect between GND and  $V_{OUT}$  as shortest path as possible for stable operation

The recommended capacitance depends on the output voltage rank. Especially, a low voltage regulator requires larger  $C_O$  value.

In addition, you should consider varied characteristics of capacitor (a frequency characteristic, a temperature characteristic, a DC bias characteristic and so on) and unevenness peculiar to a capacitor supplier enough.

When selecting  $C_O$ , recommend that have withstand voltage margin against an output voltage and superior temperature characteristics though this product is designed stability works with wide range ESR of capacitor including low ESR products.
