

BiCMOS MMIC 5-Bit DIGITAL VARIABLE GAIN AMPLIFIER, 50 - 800 MHz

Typical Applications

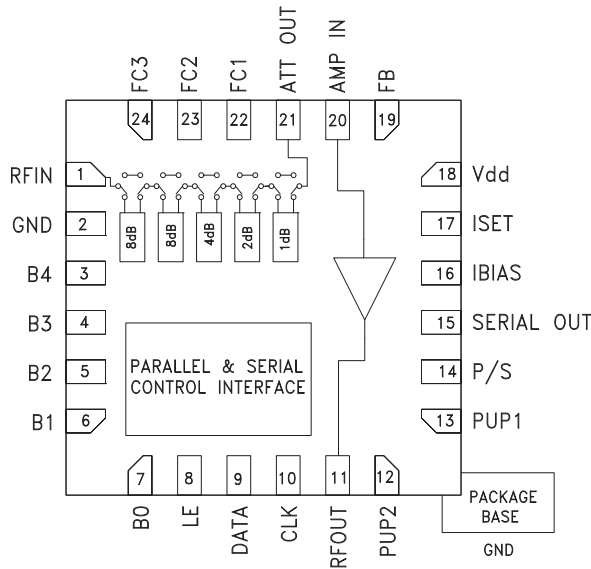

The HMC628LP4(E) is ideal for:

- Cellular/3G Infrastructure
- WiBro / WiMAX / 4G
- Microwave Radio & VSAT
- Test Equipment and Sensors
- IF & RF Applications

Features

- TTL/CMOS compatible serial, parallel or latched parallel control interface
- High Output IP3: +35 dBm (At all gain settings)
- Wide Gain Control Range: 23 dB
- Power-up State Selection
- 24 Lead 4x4 mm SMT Package: 16 mm²
- Excellent State & Step Accuracy (± 0.05 dB)

Functional Diagram

General Description

The HMC628LP4(E) is a digitally controlled variable gain amplifier which operates from 50 to 800 MHz, and can be programmed to provide anywhere from 8 dB attenuation, to 15 dB of gain, in 1.0 dB steps. The HMC628LP4(E) delivers noise figure of 5 dB in its maximum gain state, with output IP3 of up to +35 dBm in any state. The dual mode control interface is CMOS/TTL compatible, and accepts either a three wire serial input or a 5 bit parallel word. The HMC628LP4(E) also features a user selectable power up state and a serial output port for cascading other Hittite serial controlled components. The HMC628LP4(E) is housed in a RoHS compliant 4x4 mm QFN leadless package, and is available in three evaluation board configurations, depending on the application frequency.

Electrical Specifications, $T_A = +25^\circ C$, 50 Ohm System, $V_{dd} = +5V$

Parameter	50 - 250			250 - 500			500 - 800			MHz
	Min.	Typ.	Max.	Min.	Typ.	Max.	Min.	Typ.	Max.	
Gain (Maximum Gain State)	13	15		12.8	14		10.5	13		dB
Gain Control Range		23			23			23		dB
Input Return Loss		12			10			10		dB
Output Return Loss		10			12.5			9		dB
Gain Accuracy: (Referenced to Maximum Gain State)	$\pm (0.1 + 1\% \text{ of Gain Setting})_{\text{Max}}$			$\pm (0.4 + 2\% \text{ of Gain Setting})_{\text{Max}}$			$\pm (0.4 + 4\% \text{ of Gain Setting})_{\text{Max}}$			dB
Output Power for 1dB Compression	19	19.5		16	18		14	18		dBm
Output Third Order Intercept Point		35 [1]			33 [2]			32 [3]		dBm
Output Second Order Intercept Point		46 [1]			54 [2]			55 [3]		dBm
Harmonics		46			55			62		dBc
		69			75			83		dBc
Switching Characteristics	t_{RISE}, t_{FALL} (10 / 90% RF)			11						ns
	t_{ON}, t_{OFF} (Latch Enable to 10 / 90% RF)			18						ns
Noise Figure		5			6			6.5		dB
Supply Current (I_{dd})		65	85		65	85		65	85	mA

Serial Control Interface

The HMC628LP4(E) contains a 3-wire SPI compatible digital interface (DATA, CLK, LE). It is activated when P/S is kept high. The 5-bit serial word must be loaded MSB first. The positive-edge sensitive CLK and LE requires clean transitions. Standard logic families work well. If mechanical switches were used, sufficient debouncing should be provided. When LE is high, 5-bit data in the serial input register is transferred to the attenuator. When LE is high CLK is masked to prevent data transition during output loading.

When P/S is low, 3-wire SPI interface inputs (DATA, CLK, LE) are disabled and serial input register is loaded asynchronously with parallel digital inputs (B0-B4). When Le is high, 5-bit parallel data is transferred to the attenuator.

For all modes of operations, attenuation state will stay constant while LE is kept low.

Parameter	Typ.
Min. serial period, t_{sck}	100 ns
Control set-up time, t_{CS}	20 ns
Control hold-time, t_{CH}	20 ns
LE Set up-time, t_{LN}	10 ns
Min. LE pulse width, t_{LEW}	10 ns
Min LE pulse spacing, t_{LES}	530 ns
Serial clock hold-time from LE, t_{CKN}	10 ns
Hold Time, t_{PH}	0 ns
Latch Enable Minimum Width, t_{LEN}	10 ns
Setup Time, t_{PS}	2 ns

Timing Diagram (Latched Parallel Mode)

Parallel Mode (Direct Parallel Mode & Latched Parallel Mode)

Note: The parallel mode is enabled when P/S is set to low.

Direct Parallel Mode - The attenuation state is changed by the Control Voltage Inputs directly. The LE (Latch Enable) must be at a logic high to control the attenuator in this manner.

Latched Parallel Mode - The attenuation state is selected using the Control Voltage Inputs and set while the LE is in the Low state. The attenuator will not change state while LE is Low. Once all Control Voltage Inputs are at the desired states the LE is pulsed. See timing diagram above for reference.

Information furnished by Analog Devices is believed to be accurate and reliable. However, no responsibility is assumed by Analog Devices for its use, nor for any infringements of patents or other rights of third parties that may result from its use. Specifications subject to change without notice. No license is granted by implication or otherwise under any patent or patent rights of Analog Devices. BiCMOS MMIC 5-Bit DIGITAL VARIABLE GAIN AMPLIFIER, 50 - 800 MHz

Power-Up States

If LE is set to logic LOW at power-up, the logic state of PUP1 and PUP2 determines the power-up state of the part per PUP truth table. If the LE is set to logic HIGH at power-up, the logic state of B4-B0 determines the power-up state of the part per truth table. The DVGA latches in the desired power-up state approximately 200 ms after power-up.

Power-On Sequence

The ideal power-up sequence is: GND, Vdd, digital inputs, RF inputs. The relative order of the digital inputs are not important as long as they are powered after Vdd / GND

Absolute Maximum Ratings

RF Input Power	20 dBm
RF Output Power	22 dBm
Digital Inputs (B0-B4, Shift Clock, Latch Enable & Data Input)	-0.5V to Vdd +0.5V
Bias Voltage (Vdd)	5.6 V
Junction Temperature	125 °C
Continuous Pdiss (T = 85 °C) (derate 13.5 mW/°C above 85 °C) [1]	0.54 W
Thermal Resistance (Junction to ground paddle)	74.3 °C/W
Storage Temperature	-65 to +150 °C
Operating Temperature	-40 to +85 °C

Bias Voltage

Vdd (V)	Idd (Typ.) (mA)
5V	65

Control Voltage Table

State	Vdd = +3V	Vdd = +5V
Low	0 to 0.5V @ <1 μA	0 to 0.8V @ <1 μA
High	2 to 3V @ <1 μA	2 to 5V @ <1 μA

PUP Truth Table

LE	PUP1	PUP2	Gain Relative to Maximum Gain
0	0	0	Insertion Loss
0	1	0	-8
0	0	1	-16
0	1	1	-23
1	X	X	0 to -23 dB

Note: Power-Up with LE= 1 provides direct parallel operation with B4-B0.

Truth Table

ATTENUATION (dB)	B4 ^[1]	B3 ^[1]	B2	B1	B0
0	0	0	0	0	0
1	0	0	0	0	1

Pin Descriptions

Pin Number	Function	Description	Interface Schematic
1	RFIN	This pin is DC coupled and matched to 50 Ohms. A blocking capacitor is needed.	
2	GND	These pins and package bottom must be connected to RF/DC ground.	
3 - 7	B4, B3, B2, B1, B0	See Truth Table, Control Voltage Table and Timing Diagram.	
8	LE		
9	DATA		
10	CLK		
12	PUP2		
13	PUP1		
14	P/S		
15	SERIAL OUT	Serial input data delayed by 5 clock cycles.	
16	IBIAS	Bias current to amplifier. External inductor is needed.	
17	ISET	External bias resistor to adjust the current of the amplifier.	
18	Vdd	Supply Voltage.	
19	FB	Feedback capacitance for the amplifier.

Item	Description
SW1, SW2	SPDT 4 Position Dip Switch
U1	HMC628LP4(E) Variable Gain Amplifier
PCB [2]	118413 Evaluation PCB

[1] When requesting an evaluation board, please reference the appropriate PCB number listed in the table "Components for Selected Frequencies."

[2] Circuit Board Material: Arlon 25FR / FR4

The circuit board used in the application should use RF circuit design techniques. Signal lines should have 50 Ohm impedance while the package ground leads and exposed paddle should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation circuit board shown is available from Hittite upon request.
