

Please note that Cypress is an Infineon Technologies Company.

The document following this cover page is marked as “Cypress” document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

Continuity of document content

The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

Continuity of ordering part numbers

Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.

Features

- Temperature ranges
 - Automotive-E: -40 °C to 125 °C
- High speed
 - $t_{AA} = 10$ ns
- Low active power
 - 468 mW (max)
- 2.0 V data retention
- Automatic power down when deselected
- Independent control of upper and lower bits
- Easy memory expansion with Chip Enable (\overline{CE}) and Output Enable (\overline{OE}) features
- Available in Pb-free 48-ball grid array (BGA) package

Functional Description

The CY7C1011CV33 Automotive is a high performance complementary metal oxide semiconductor (CMOS) static RAM organized as 131,072 words by 16 bits. This device has an automatic power down feature that significantly reduces power consumption when deselected.

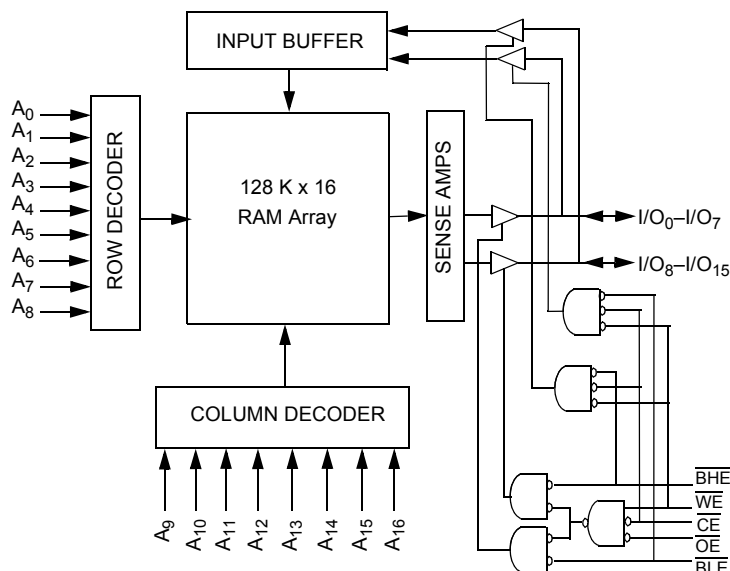

To write to the device, take \overline{CE} and Write Enable (\overline{WE}) inputs LOW. If Byte Low Enable (\overline{BLE}) is LOW, then data from I/O pins (I/O_0 through I/O_7), is written into the location specified on the address pins (A_0 through A_{16}). If Byte High Enable (\overline{BHE}) is LOW, then data from I/O pins (I/O_8 through I/O_{15}) is written into the location specified on the address pins (A_0 through A_{16}).

To read from the device, take \overline{CE} and \overline{OE} LOW while forcing the Write Enable (\overline{WE}) HIGH. If \overline{BLE} is LOW, then data from the memory location specified by the address pins appear on I/O_0 to I/O_7 . If Byte High Enable (\overline{BHE}) is LOW, then data from memory appears on I/O_8 to I/O_{15} . For more information, see the [Truth Table on page 10](#) for a complete description of Read and Write modes.

The input and output pins (I/O_0 through I/O_{15}) are placed in a high impedance state when the device is deselected (\overline{CE} HIGH), the outputs are disabled (\overline{OE} HIGH), the \overline{BHE} and \overline{BLE} are disabled (\overline{BHE} , \overline{BLE} HIGH), or during a write operation (\overline{CE} LOW and \overline{WE} LOW).

t_{HZWE}	WE LOW to High Z ^[7, 8]	–	5	ns
t_{BW}	Byte enable to end of write	7	–	ns

Notes

- Test conditions assume signal transition time of 3 ns or less, timing reference levels of 1.5 V, and input pulse levels of 0 to 3.0 V.
- t_{POWER} gives the minimum amount of time that the power supply is at typical V_{CC} values until the first memory access is performed.
- At any temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any device.
- t_{HZOE} , t_{HZBE} , t_{HZCE} , and t_{HZWE} are specified with a load capacitance of 5 pF as in part (c) of [Figure 2 on page 5](#). Transition is measured ± 500 mV from steady state voltage.
- The internal write time of the memory is defined by the overlap of CE LOW, WE LOW, and BHE/BLE LOW. CE, WE, and BHE/BLE must be LOW to initiate a write. The transition of these signals terminate the write. The input data setup and hold timing is referenced to the leading edge of the signal that terminates the write.
- The minimum write cycle time for Write Cycle No. 3 (WE controlled, OE LOW) is the sum of t_{HZWE} and t_{SD} .

Switching Waveforms

Figure 3. Read Cycle No. 1 (Address Transition Controlled) [11, 12]

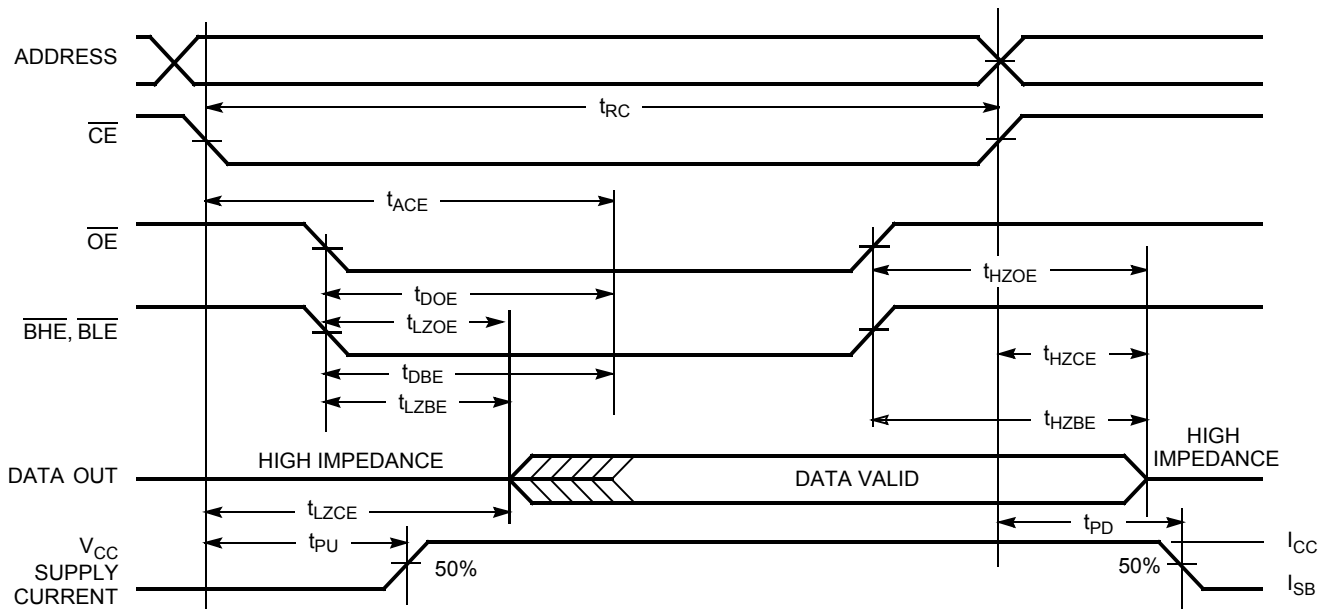

Figure 4. Read Cycle No. 2 (\overline{OE} Controlled) [12, 13]

Notes

- 11. Device is continuously selected. \overline{OE} , \overline{CE} , \overline{BHE} , and/or \overline{BLE} = V_{IL} .
- 12. \overline{WE} is HIGH for read cycle.
- 13. Address valid prior to or coincident with \overline{CE} transition LOW.

Figure 5. Write Cycle No. 1 ($\overline{\text{CE}}$ Controlled) [14, 15]

Figure 6. Write Cycle No. 2 ($\overline{\text{BLE}}$ or $\overline{\text{BHE}}$ Controlled)

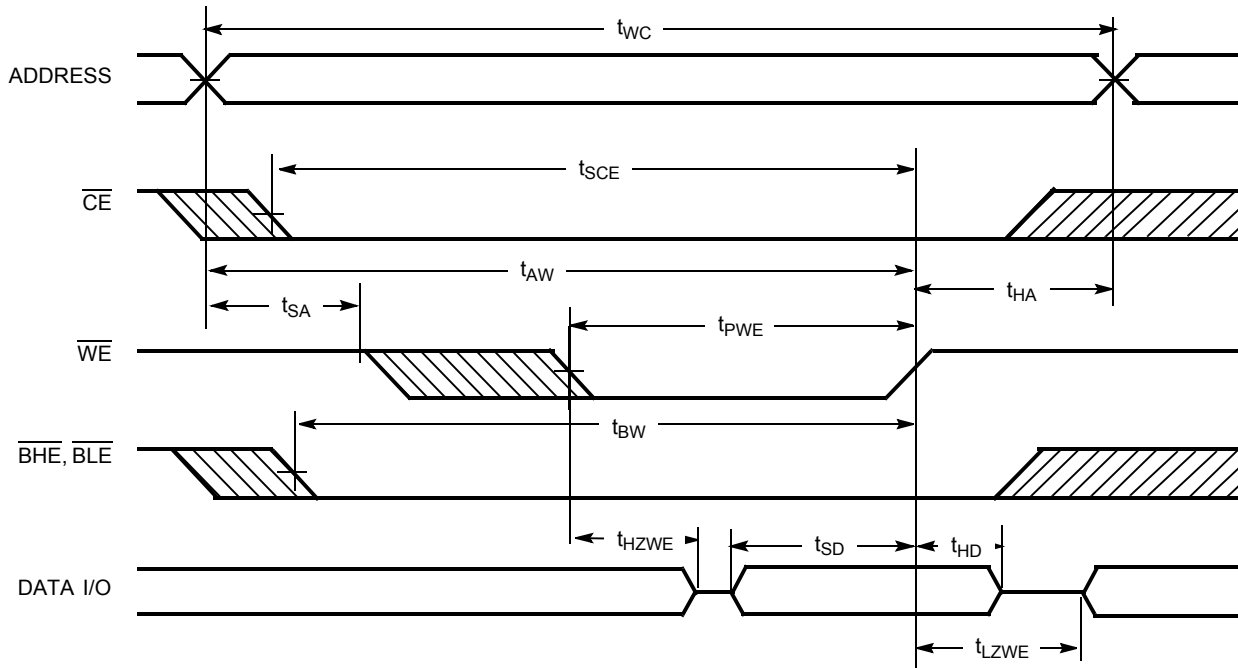

Notes

- 14. Data I/O is high impedance if $\overline{\text{OE}}$, $\overline{\text{BHE}}$, and/or $\overline{\text{BLE}} = V_{IH}$.
- 15. If $\overline{\text{CE}}$ goes HIGH simultaneously with $\overline{\text{WE}}$ going HIGH, the output remains in a high impedance state.
