WM8233

210MSPS 6-Channel AFE with Sensor Timing Generation and LVDS/CMOS Data Output

DESCRIPTION

The WM8233 is a 16-bit analogue front end/digitiser IC which processes and digitises the analogue output signals from CCD sensors or Contact Image Sensors (CIS) at pixel sample rates of up to 35MSPS per channel.

The device has six analogue signal processing channels each of which contains Reset Level Clamping, Correlated Double Sampling (also Sample and Hold), Programmable Gain, Automatic Gain Control (AGC) and Offset adjust functions.

The output from each of these channels is time multiplexed, in pairs, into three high-speed 16-bit Analogue to Digital Converters. The digital data is available in a variety of output formats via the flexible data port.

The WM8233 has a user selectable LVDS or CMOS output architecture.

An internal 5-bit DAC is supplied for internal reference level generation. This may be used during CDS to reference CIS signals or during clamping to clamp CCD signals. An external reference level may also be supplied. ADC references are generated internally, ensuring optimum performance from the device.

A programmable automatic Black-Level Calibration function is available to adjust the DC offset of the output data.

The WM8233 features a sensor timing clock generator for both CCD and CIS sensors. The clock generator can accept a slow or fast reference clock input and also has a flexible timing adjustment function for output timing clocks to allow use of many different sensors.

FEATURES

- 210MSPS conversion rate
- 16-bit ADC resolution
- Current consumption – 350mA
- 3.3V single supply operation
- Sample and hold /correlated double sampling
- Programmable offset adjust (8-bit resolution)
- Flexible clamp timing
- Pixel clamp / line clamp mode
- Programmable clamp voltage
- Programmable CIS/CCD timing generator
- Internally generated voltage references
- Compliant for Spread Spectrum Clock
- LVDS/CMOS output options
  - LVDS 5pair 490MHz 35-bit data
  - CMOS 90MHz output maximum
- Complete on chip clock generator. MCLK 5MHz to 35MHz
- Internal timing adjustment
- Automatic Gain Control
- Automatic Black Level Calibration
- 56-lead QFN package 8mm x 8mm
- Serial control interface

APPLICATIONS

- Digital copiers
- USB2.0 compatible scanners
- Multi-function peripherals
- High-speed CCD/CIS sensor interface

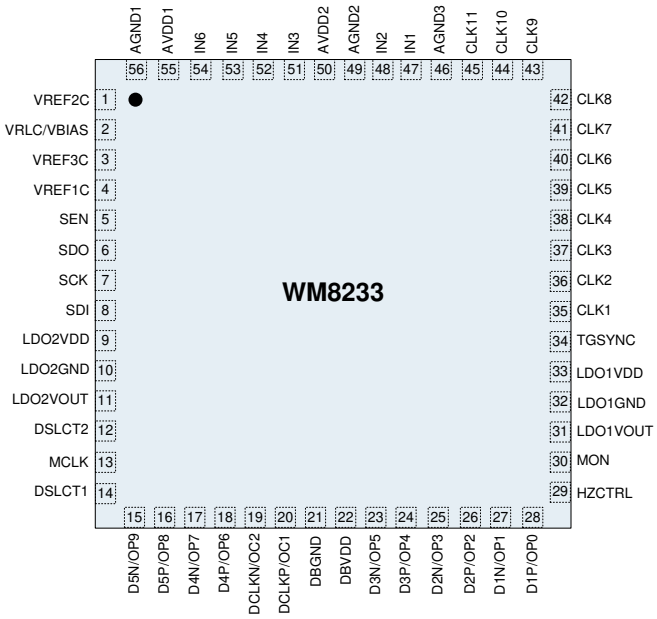
PIN CONFIGURATION



ORDERING INFORMATION

DEVICE	TEMPERATURE RANGE	PACKAGE	MOISTURE SENSITIVITY LEVEL	PEAK SOLDERING TEMPERATURE
WM8233GEFL/V	-40 to 85°C	56-lead QFN (8 x 8 x 0.85 mm) (Pb-free)	MSL3	260°C
WM8233GEFL/RV	-40 to 85°C	56-lead QFN (8 x 8 x 0.85 mm) (Pb-free, tape and reel)	MSL3	260°C

Reel quantity = 2,200

PIN DESCRIPTION

PIN	NAME	TYPE	DESCRIPTION
1	VREF2C	Analogue output	Mid reference voltage. This pin must be connected to AGND via a decoupling capacitor.
2	VRLC/VBIAS	Analogue I/O	Reference voltage input/output
3	VREF3C	Analogue output	Lower reference voltage. This pin must be connected to AGND via a decoupling capacitor.
4	VREF1C	Analogue output	Upper reference voltage. This pin must be connected to AGND via a decoupling capacitor.
5	SEN	Digital input	Enables the serial interface when high.
6	SDO	Digital output	Serial interface data output
7	SCK	Digital input	Serial interface clock.
8	SDI	Digital input	Serial interface data input
9	LDO2VDD	Supply	Analogue supply
10	LDO2GND	Supply	Analogue ground
11	LDO2VOUT	Supply	LDO output This pin must be connected to AGND via a decoupling capacitor.
12	DSLCT2	Analogue input	Device select 2
13	MCLK	Analogue input	Master clock
14	DSLCT1	Analogue input	Device select 1
15	D5N/OP[9]	LVDS output	LVDS Data output 5 – Negative / CMOS output 9.
16	D5P/OP[8]	LVDS output	LVDS Data output 5 – Positive / CMOS output 8.
17	D4N/OP[7]	LVDS output	LVDS Data output 4 – Negative / CMOS output 7.
18	D4P/OP[6]	LVDS output	LVDS Data output 4 – Positive / CMOS output 6.
19	DCLKN/OC[2]	LVDS output	LVDS Clock Output – Negative/ CMOS flag output.
20	DCLKP/OC[1]	LVDS output	LVDS Clock Output – Positive/ CMOS clock output.
21	DBGND	Supply	Analogue ground
22	DBVDD	Supply	Analogue supply
23	D3N/OP[5]	LVDS output	LVDS Data output 3 – Negative / CMOS output 5.
24	D3P/OP[4]	LVDS output	LVDS Data output 3 – Positive / CMOS output 4.
25	D2N/OP[3]	LVDS output	LVDS Data output 2 – Negative / CMOS output 3.
26	D2P/OP[2]	LVDS output	LVDS Data output 2 – Positive / CMOS output 2.
27	D1N/OP[1]	LVDS output	LVDS Data output 1 – Negative / CMOS output 1.
28	D1P/OP[0]	LVDS output	LVDS Data output 1 – Positive / CMOS output 0.
29	HZCTRL	Digital input	Internal use only. Must be connected to AGND.
30	MON	Analogue output	Clock monitor
31	LDO1VOUT	Supply	LDO output. This pin must be connected to AGND via a decoupling capacitor.
32	LDO1GND	Supply	Analogue ground
33	LDO1VDD	Supply	Analogue supply
34	TGSYNC	Digital I/O	Sensor Timing Sync pulse
35	CLK1	Digital output	Sensor Timing Output 1
36	CLK2	Digital output	Sensor Timing Output 2
37	CLK3	Digital output	Sensor Timing Output 3
38	CLK4	Digital output	Sensor Timing Output 4
39	CLK5	Digital output	Sensor Timing Output 5
40	CLK6	Digital output	Sensor Timing Output 6
41	CLK7	Digital output	Sensor Timing Output 7
42	CLK8	Digital output	Sensor Timing Output 8
43	CLK9	Digital output	Sensor Timing Output 9
44	CLK10	Digital output	Sensor Timing Output 10
45	CLK11	Digital output	Sensor Timing Output 11
46	AGND3	Supply	Analogue ground

PIN	NAME	TYPE	DESCRIPTION
47	IN1	Analogue input	Analogue input 1
48	IN2	Analogue input	Analogue input 2
49	AGND2	Supply	Analogue ground
50	AVDD2	Supply	Analogue supply
51	IN3	Analogue input	Analogue input 3
52	IN4	Analogue input	Analogue input 4
53	IN5	Analogue input	Analogue input 5
54	IN6	Analogue input	Analogue input 6
55	AVDD1	Supply	Analogue supply
56	AGND1	Supply	Analogue ground

ABSOLUTE MAXIMUM RATINGS

Absolute Maximum Ratings are stress ratings only. Permanent damage to the device may be caused by continuously operating at or beyond these limits. Device functional operating limits and guaranteed performance specifications are given under Electrical Characteristics at the test conditions specified.

ESD Sensitive Device. This device is manufactured on a CMOS process. It is therefore generically susceptible to damage from excessive static voltages. Proper ESD precautions must be taken during handling and storage of this device.

Cirrus Logic tests its package types according to IPC/JEDEC J-STD-020 for Moisture Sensitivity to determine acceptable storage conditions prior to surface mount assembly. These levels are:

MSL1 = unlimited floor life at <30°C / 85% Relative Humidity. Not normally stored in moisture barrier bag.
MSL2 = out of bag storage for 1 year at <30°C / 60% Relative Humidity. Supplied in moisture barrier bag.
MSL3 = out of bag storage for 168 hours at <30°C / 60% Relative Humidity. Supplied in moisture barrier bag.

The Moisture Sensitivity Level for each package type is specified in Ordering Information.

CONDITION	MIN	MAX
Analogue supply voltage: AVDD1-2, LDO1VDD-2, DBVDD	GND - 0.3V	GND + 5V
Analogue grounds: AGND1-3, LDO1GND-LDO2GND, DBGND	GND - 0.3V	GND + 0.3V
Analogue inputs (IN1-6)	GND - 0.3V	AVDD + 0.3V
Other Analogue pins	GND - 0.3V	AVDD + 0.3V
Digital I/O pins	GND - 0.3V	AVDD + 0.3V
Operating temperature range: T_A	-40°C	+85°C
Storage temperature prior to soldering	30°C max / 85% RH max	
Storage temperature after soldering	-65°C	+150°C

Notes:

1. GND denotes the voltage of any ground pin.
2. AGND, LDOGND and DBGND pins are intended to be operated at the same potential. Differential voltages between these pins will degrade performance.

RECOMMENDED OPERATING CONDITIONS

Total supply current – full power down mode				1.2		mA

Notes:

1. **Full-scale input voltage** denotes the differential input signal amplitude (V_{IN}-VRLC in non-CDS mode, V_{IN}-RESET level in CDS mode) that corresponds to the ADC full-scale input level.
2. **If AVDD < 3.0V, the VRLC input voltage must not exceed AVDD.**

INTERNAL POWER ON RESET CIRCUIT

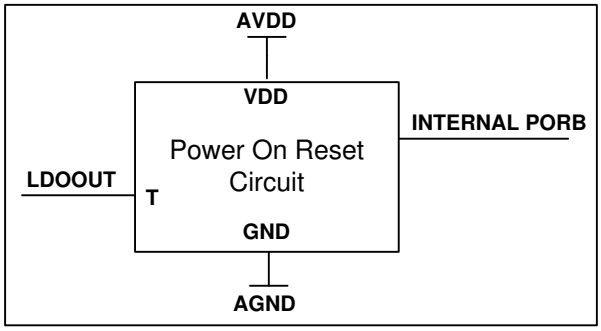

Figure 1 Internal Power On Reset Circuit Schematic

The WM8233 includes an internal Power-On-Reset Circuit, as shown in Figure 1, which is used reset the digital logic into a default state after power up. The POR circuit is powered from AVDD and monitors LDOOUT. It asserts PORB low if AVDD or LDOOUT is below a minimum threshold.

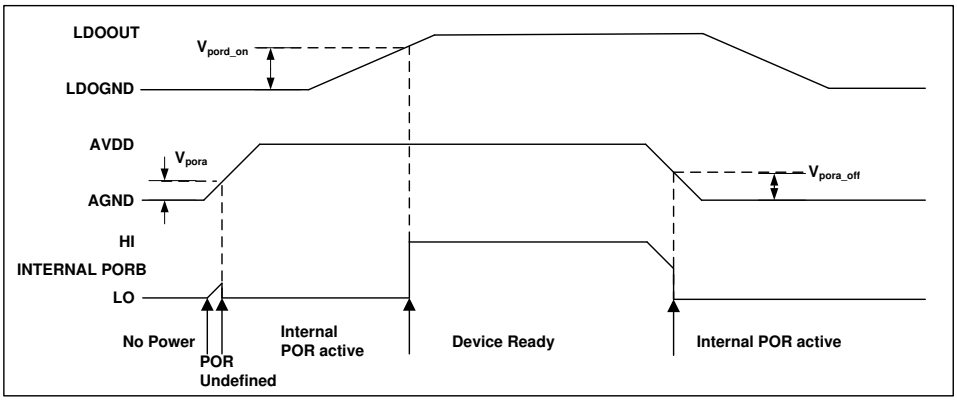

Figure 2 Typical Power up Sequence where AVDD is Powered before LDOOUT

Figure 2 shows a typical power-up sequence where AVDD is powered up first. When AVDD rises above the minimum threshold, Vpora, there is enough voltage for the circuit to guarantee PORB is asserted low and the chip is held in reset. In this condition, all writes to the control interface are ignored. When LDOOUT rises to Vpord_on, PORB is released high and all registers are in their default state and writes to the control interface may take place. On power down, where AVDD falls first, PORB is asserted low whenever AVDD drops below the minimum threshold Vpora_off.

SYMBOL	MIN	TYP	MAX	UNIT
Vpora	0.4	0.6	0.8	V
Vpora_off	0.4	0.6	0.8	V
Vpord_on	0.5	0.7	0.9	V

Table 1 Typical POR Operation (typical values, not tested)

SIGNAL TIMING REQUIREMENTS

SERIAL CONTROL INTERFACE

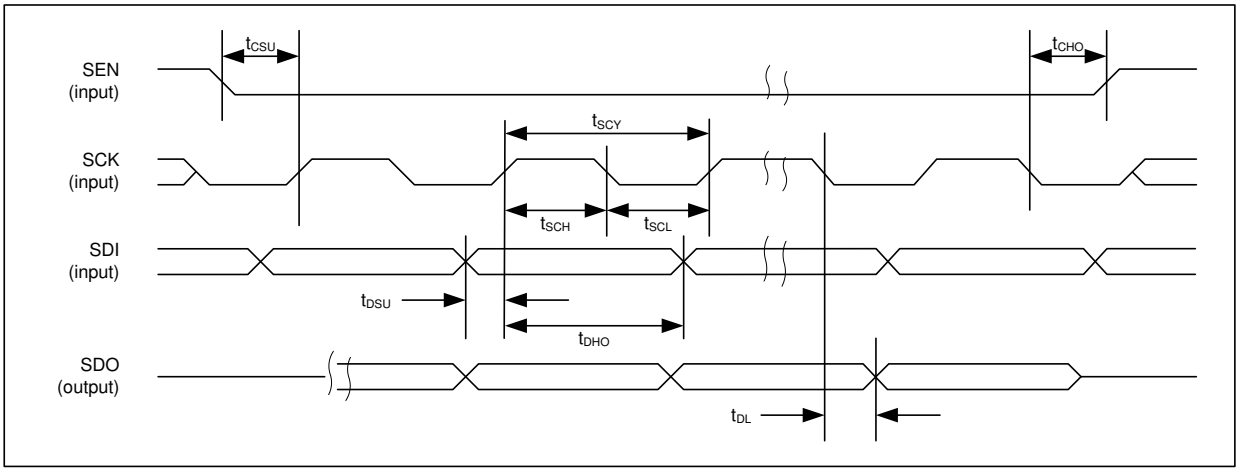

Figure 3 Serial Interface Timing

PARAMETER	SYMBOL	TEST CONDITIONS	MIN	TYP	MAX	UNITS
SEN falling edge to SCK rising edge	t_{CSU}		20			ns
SCK falling edge to SEN rising edge	t_{CHO}		20			ns
SCK pulse cycle time	t_{SCY}		83.3			ns
SCK pulse width low	t_{SCL}		33			ns
SCK pulse width high	t_{SCH}		33			ns
SDI to SCK set-up time	t_{DSU}		20			ns
SDI to SCK hold time	t_{DHO}		20			ns
SCK falling edge to SDO transition	t_{DL}				33	ns

The internal control registers are programmable via the serial digital control interface. The register contents can be read back via the serial interface on pin SDO.

It is recommended that a software reset is carried out after the power-up sequence, before writing to any other register. This ensures that all registers are set to their default values.

DEVICE IDENTIFICATION

Up to 4 WM8233 devices can share a common set of serial interface pins. Each device on the common interface bus must be given a different device ID. The device ID is set by the input pin DSLCT2 and DSLCT1 as shown in Table 2.

DSLCT2	DSLCT1	DEVICE ID (ID[1:0])
L	L	00
L	H	01
H	L	10
H	H	11

Table 2 Device Identification

REGISTER WRITE

Figure 4 shows the sequence of operations for performing a register write. Three pins, SCK, SDI and SEN are used for the control interface. A 16-bit address (R/W, CS0, CS1, CS2, A11 to A0) is clocked in through SDI, MSB first, followed by an 8-bit data word (b7 to b0), also MSB first. Setting address bit R/W to 0 indicates that the operation is a register write. The device ID bits (CS0 and CS1) indicate which device is being written to on a shared control bus. A register write with CS2 set to 1 writes data to all devices on the common bus. Each bit is latched on the rising edge of SCK. When the data has been shifted into the device, a rising edge on the SEN pin transfers the data to the appropriate internal register.

CS2	CS1 (DSLCT2)	CS0 (DSLCT1)	DESCRIPTION
0	ID[1:0]		Indicated a device to write data
1	X	X	Writes data to all devices

Table 3 Device Identification

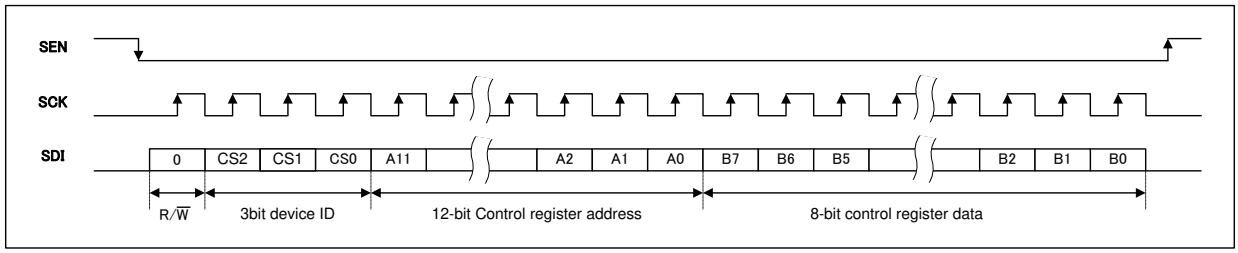

Figure 4 Serial Interface Register Write

REGISTER READ-BACK

Figure 5 shows register read-back in serial mode. Read-back is initiated by writing to the serial bus as described above but with address bit R/W set to 1, followed by an 8-bit dummy data word. Writing address (A11 to A0) will cause the contents (B7 to B0) of corresponding register in the addressed device to be output MSB first on pin SDO (on the following edge of SCK). In this mode, the CS2 register should be set to 0.

DEVICE DESCRIPTION

INTRODUCTION

A block diagram of the device showing the signal path is presented on the front page of this datasheet.

The WM8233 samples up to six inputs (IN1, IN2IN2, IN3, IN4, IN5 and IN6) simultaneously. The device then processes the sampled video signal with respect to the video reset level or an internally/externally generated reference level using between one and six processing channels.

Each processing channel consists of an Input Sampling block with optional Reset Level Clamping (RLC) and Correlated Double Sampling (CDS), an 8-bit programmable offset DAC and a 12-bit Programmable Gain Amplifier (PGA).

The processing channel outputs are switched, in pairs, alternately by a 2:1 multiplexer to the three ADC inputs.

The ADC then converts each resulting analogue signal to a digital word. The digital output from the ADC is presented in a variety of possible output formats in LVDS and CMOS format.

On-chip control registers determine the configuration of the device, including the offsets and gains applied to each channel. These registers are programmable via a serial interface.

The device has an automatic Black-Level Calibration function which allows the D.C. offset determined during the optically-black pixels at the beginning of the linear sensor to be removed during the image-pixels.

The WM8233 also has an Automatic Gain Control function which automatically adjusts the gain to an appropriate level for a detected input level.

The device incorporates a sensor timing generation function which allows CCD and CMOS sensor timing to be controlled directly from the device using internal clock generation and register settings.

RESET LEVEL CLAMPING (RLC)

To ensure that the signal applied to the WM8233 lies within the supply voltage range (0V to AVDD), the output signal from a CCD is usually level shifted by coupling through a capacitor, $C_{IN.}$ The RLC circuit clamps the WM8233 side of this capacitor to a suitable voltage through a CMOS switch during the CCD reset period (pixel clamping) or during the black pixels (line clamping). In order for clamping to produce correct results the input voltage during the clamping must be a constant value.

Note that if the A.C. coupling capacitor (C_{IN}) is used in non-CDS mode (CDS=0), then to minimise code drift, line clamping should be used and internal input voltage buffers enabled using the SF_INP and SF_VRLC register bit. Alternatively, if the input signal contains a stable reference/reset level, then pixel clamping should be used, and the voltage buffers need not be enabled.

The WM8233 allows the user to control the RLC switch in a variety of ways as illustrated in Figure 10. This figure shows a single channel; however, all 6 channels are identical, each with its own clamp switch controlled by the common CLMP signal.

The method of control chosen depends upon the characteristics of the input video. The VRLCEN register bit must be set to 1 to enable clamping; otherwise, the RLC switch cannot be closed (by default VRLCEN=1).

Note that unused inputs should be left floating, or grounded through a decoupling capacitor, if reset level clamping is used.

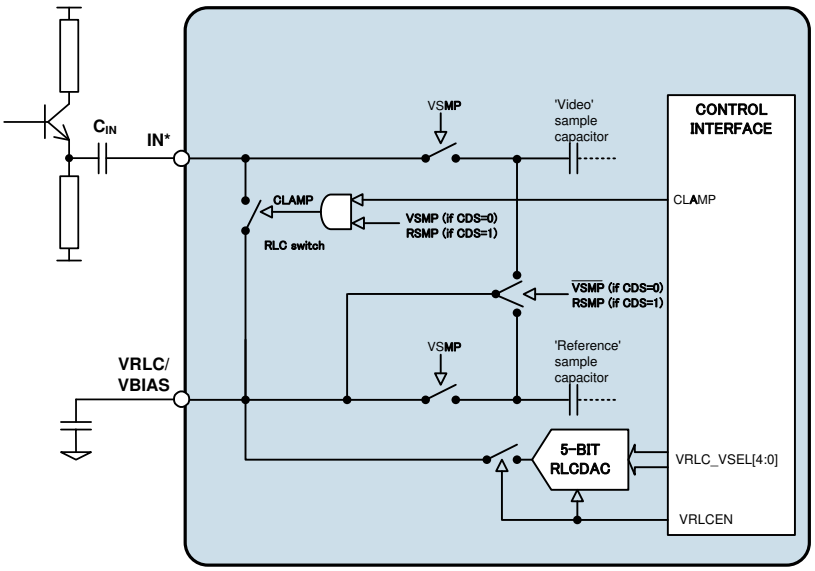

Figure 10 RLC Clamp Control Options

In CDS operation, when an input waveform has a stable reference level on every pixel, it may be desirable to clamp every pixel during this period. Setting CLAMP=high means that the RLC switch is closed whenever the RSMP is high, as shown in Figure 11.

In non-CDS operation, setting CLAMP=high means that the RLC switch is closed whenever the VSMP is high, as shown in Figure 12.

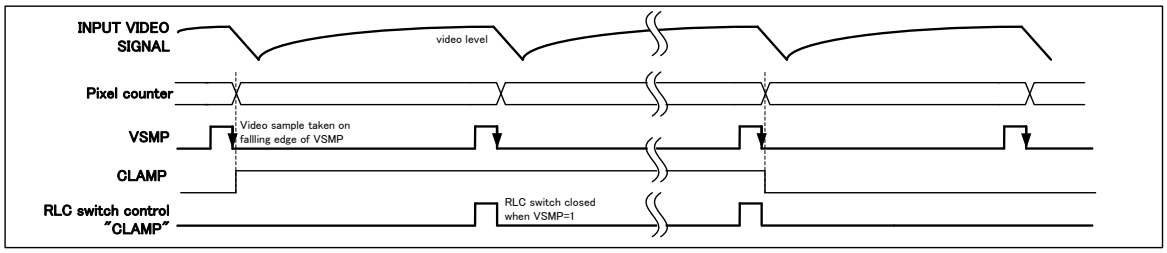

Figure 12 Line Clamp Operation, non-CDS operation shown

CDS/NON-CDS PROCESSING

For CCD type input signals, containing a fixed reference/reset level, the signal may be processed using Correlated Double Sampling (CDS), which will remove pixel-by-pixel common mode noise. With CDS processing, the input waveform is sampled at two different points in time for each pixel, once during the reference/reset level and once during the video level. To sample using CDS, register bit CDS must be set to 1 (default = 0). This causes the signal reference to come from the video reference level as shown in Figure 13.

For input signals that do not contain a reference/reset level (e.g. CIS sensor signals), non-CDS processing is used (CDS=0). In this case, the video level is processed with respect to the voltage on pin VRLC/VBIAS. The VRLC/VBIAS voltage is sampled at the same time as input samples the video level in this mode. Note that if the A.C. coupling capacitor (C_{IN}) is used in non-CDS mode (CDS=0), then to minimise code drift, line clamping should be used and internal input voltage buffers enabled using the CLPMD register bit. Alternatively, if the input signal contains a stable reference/reset level, then pixel clamping should be used, and the voltage buffers need not be enabled.

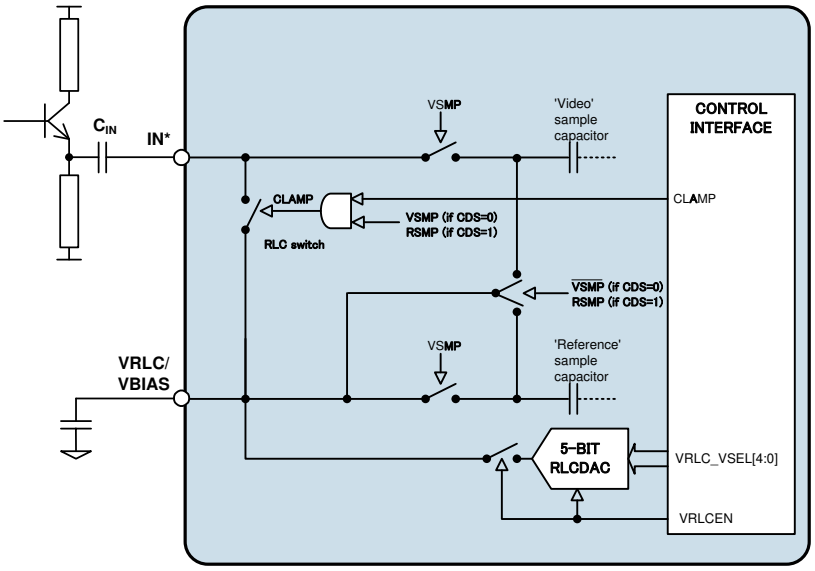

Figure 13 CDS/non-CDS Input Configuration

OFFSET ADJUST AND PROGRAMMABLE GAIN

The output from the CDS block is a differential signal, which is added to the output of an 8-bit Offset DAC to compensate for offsets and then amplified by a 12-bit PGA. The gain and offset for each channel are independently programmable by writing to control bits DACINP[7:0] for the Offset DAC, and AGAIN[4:0] and DGAIN[11:0] for the PGA.

The gain characteristic of the WM8233 PGA is shown in Figure 14.

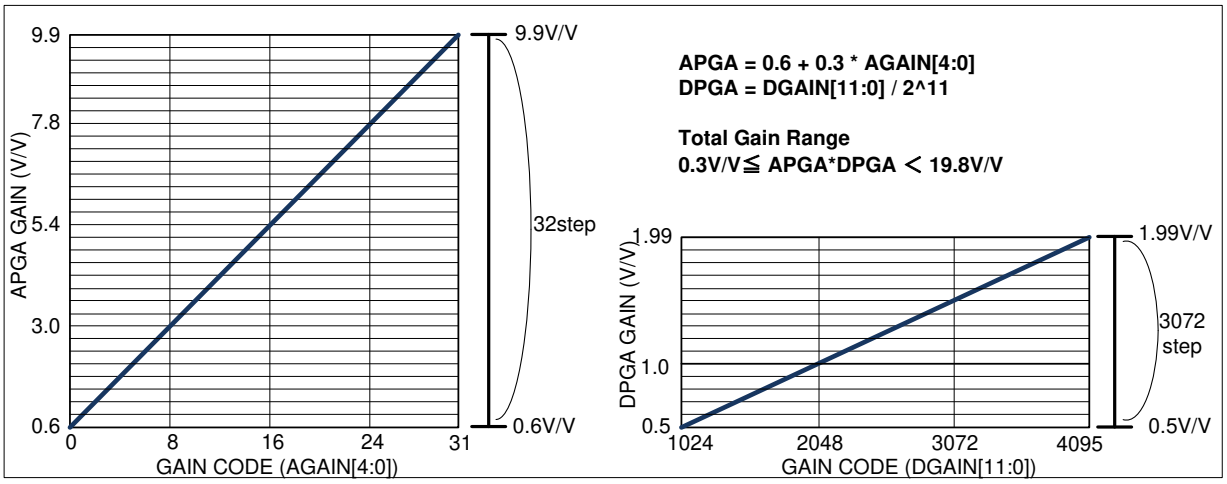

Figure 14 PGA Gain Characteristic

ADC INPUT BLACK LEVEL ADJUST

The output from the PGA can be offset to match the full-scale range of the differential ADC (1.5*[VREF1C-VREF3C]).

For negative-going input video signals, a black level (zero differential) output from the PGA should be offset to the top of the ADC range by setting register bits PGAFS=0. For positive going input signals the black level should be offset to the bottom of the ADC range by setting PGAFS=1.

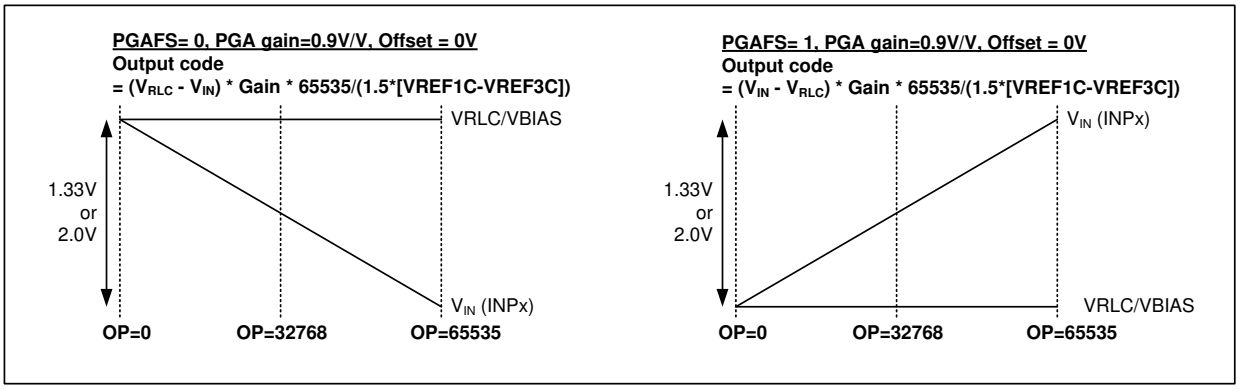

Figure 15 ADC Input Black Level Adjust Settings

OVERALL SIGNAL FLOW SUMMARY

Figure 16 represents the processing of the video signal through the WM8233.

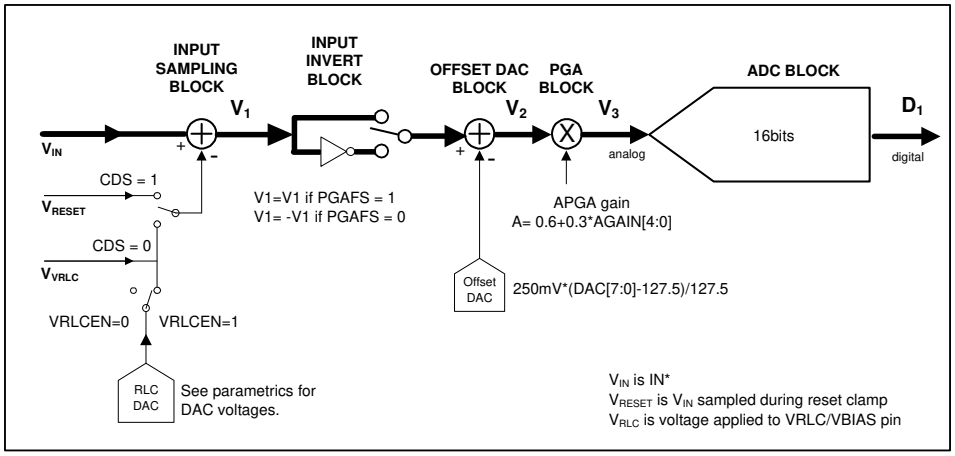

Figure 16 Overall Signal Flow

The **INPUT SAMPLING BLOCK** produces an effective input voltage $\mathbf{V_1}$. For CDS, this is the difference between the input video level V_{IN} and the input reset level V_{RESET}. For non-CDS this is the difference between the input video level V_{IN} and the voltage on the VRLC/VBIAS pin, V_{VRLC}, optionally set via the RLC DAC.

The **OFFSET DAC BLOCK** then adds the amount of fine offset adjustment required to move the black level of the input signal towards 0V, producing $\mathbf{V_2}$.

The **PGA BLOCK** then amplifies the white level of the input signal to maximise the ADC range, outputting voltage $\mathbf{V_3}$.

The **ADC BLOCK** then converts the analogue signal, $\mathbf{V_3}$, to a 16-bit unsigned digital output, $\mathbf{D_1}$.

ADC PGA BIAS CURRENT CONTROL

The WM8233 can be changed the bias current for PGA and ADC comparator as the following step. It would be effective for high frequency operation.

1. R1C0h=1
2. R1CBh=11h

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
R448 (1C0h) User access control2	0	User_KEY2	0	0 = User access2 disabled 1 = User access2 enabled

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
R459 (1CBh) Comp control	1:0	PT_COMP	01	01 = Standard operation 11 = High performance operation Other = Inhibit.

Notes:

1. To change the Comp control, the USER_KEY2 bit must be set to '1'.
2. If it's not required to change this register, must be set as default.

PLL DLL SETUP

WM8233 is supporting wide range of input frequency. PLL_EXDIV_SEL[2:0], LVDLGAIN[1:0] and DLGAIN[1:0] must be configured by MCLK clock rate and data output format.

Note that after PLL and DLL configuration, the device must be reset as the following step.

- R03[1:0]=11 (PDMD=1, PD=1)
- Delay 1ms
- R03[1:0]=00 (Normal operation)

Also, several LVDS operation mode is required to change internal LDO configuration to perform LVDS clocking properly. The following register need to set to change the LDO configuration.

- R1B0h=1
- R1B4h=12h

	Max sample rate	MCLK Clock rate [MHz]	23.4 ~ 35.0	21.1 ~ 23.3	20.0 ~ 21.0	17.5 ~ 19.99	15.0 ~ 17.49	12.5 ~ 14.99	12.0 ~ 12.49	8.33 ~ 11.99	7.5 ~ 8.32	6.0 ~ 7.49	5.0 ~ 5.99

OUTPUT DATA FORMAT

The output from the WM8233 can be presented in several different formats under control of the CMOSMODE and the LVDSMODE register. Depending on the output modes, the maximum MCLK rate is different as shown in Table 5.

MODES	DESCRIPTION	OUTPUT DATA RATE	MAXIMUM MCLK RATE
1	LVDS 10-bit 5pair	MCLK x14	35MSPS
2	LVDS 16-bit 5pair	MCLK x21	23.3MSPS
3	LVDS 10-bit 3pair	MCLK 21	21.0MSPS
4	LVDS 16-bit 3pair	MCLK x42	10.5MSPS
5	LVDS 12-bit 4pair	MCLK 21	21.0MSPS
6	CMOS 10-bit	MCLK x6	15MSPS

Table 10 10-bit CMOS Output Format

CLOCK TIMING CONFIGURATION

The RSMP signal, VSMP signal and clock output from CLK pin are generated internally by 60 tap DLL circuit. The rising and falling timing of each clock is set by DLL tap setting. The following setting and timing chart shows example configuration for RSMP, VSMP and CLK1.

RSMP: 0x82(RSMP_RISE)=0x07(dec7), 0x83(RSMP_FALL)=0x10(dec16)

VSMP: 0x84(VSMP_RISE)=0x1C(dec28), 0x85(VSMP_FALL=0x29(dec41)

CLK1: 0x87(CLK1_RISE)=0x39(dec57), 0x88(CLK1_FALL)=0x0B(dec11)

SENSOR TIMING GENERATION

The WM8233 provides two types of clock internally. C_CK* are high speed clocks, these clocks can set the clock phase by using fine pitch phase control. P_CK* are pixel rate signals which is selected

by PO0 to PO7. The WM8233 has eleven sensor TG outputs pins. CLK1 is for clock type use only. CLK2, CLK3, CLK4, CLK5 and CLK6 are selectable high speed type signal or pulse type signal. CLK7, CLK8, CLK9, CLK10 and CLK11 are pulse type use only.

TG MASTER MODE OPERATION

In master mode, line length is defined by LLENGTH register.

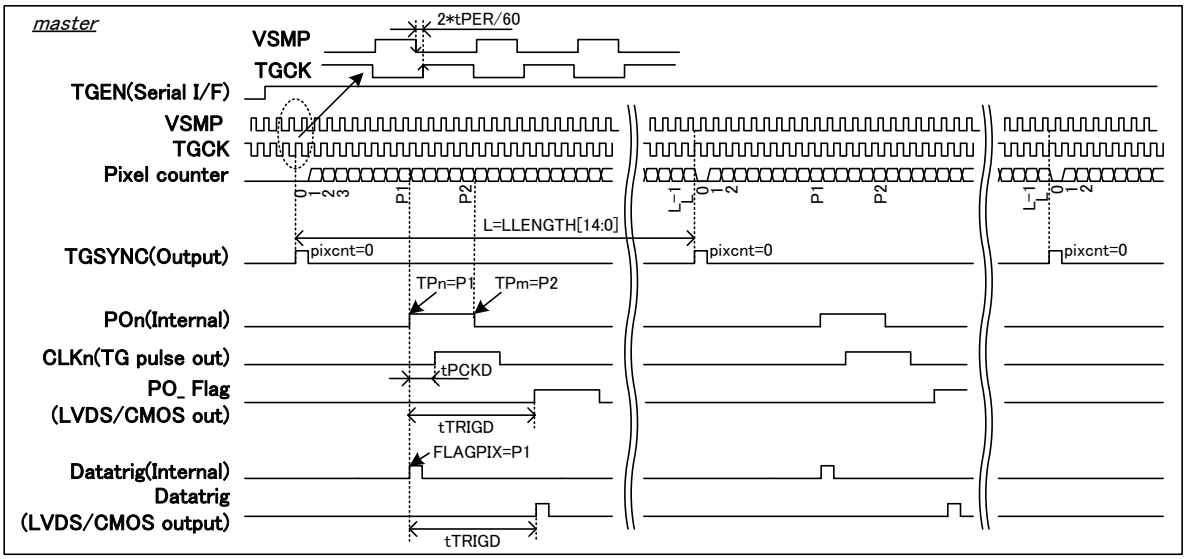

Figure 19 Master Mode Pixel Counter and Line Start Timing

TG SLAVE MODE OPERATION

In slave mode, line length depends on TGSYNC input. The pixel counter is reset by TGSYNC input.

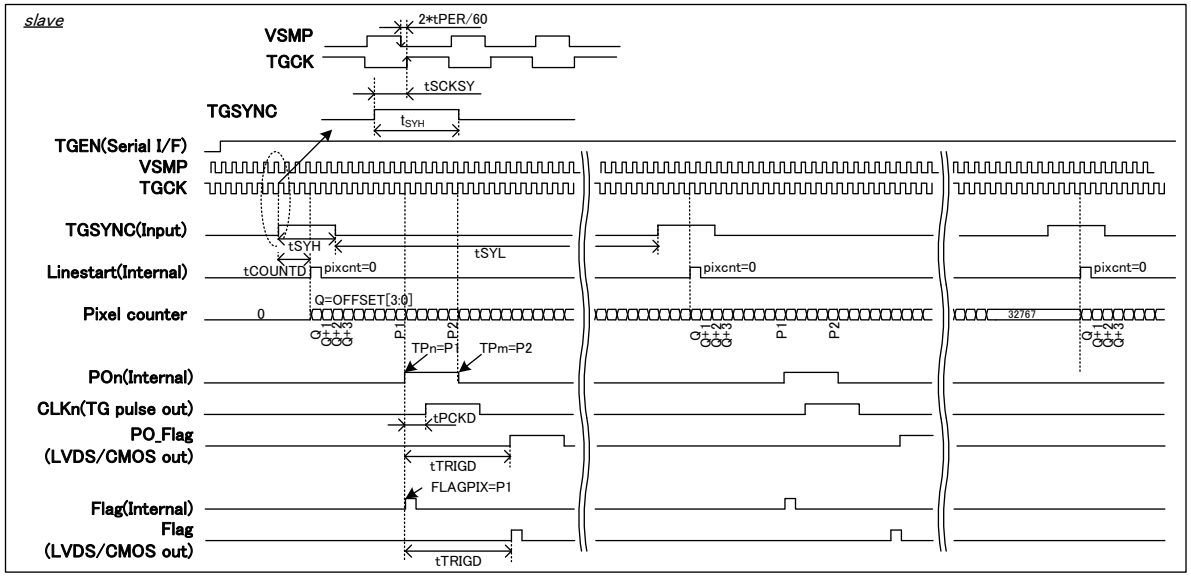

Figure 20 Slave Mode Pixel Counter and Line Start Timing

TG PULSE AND TRIGGER DATA

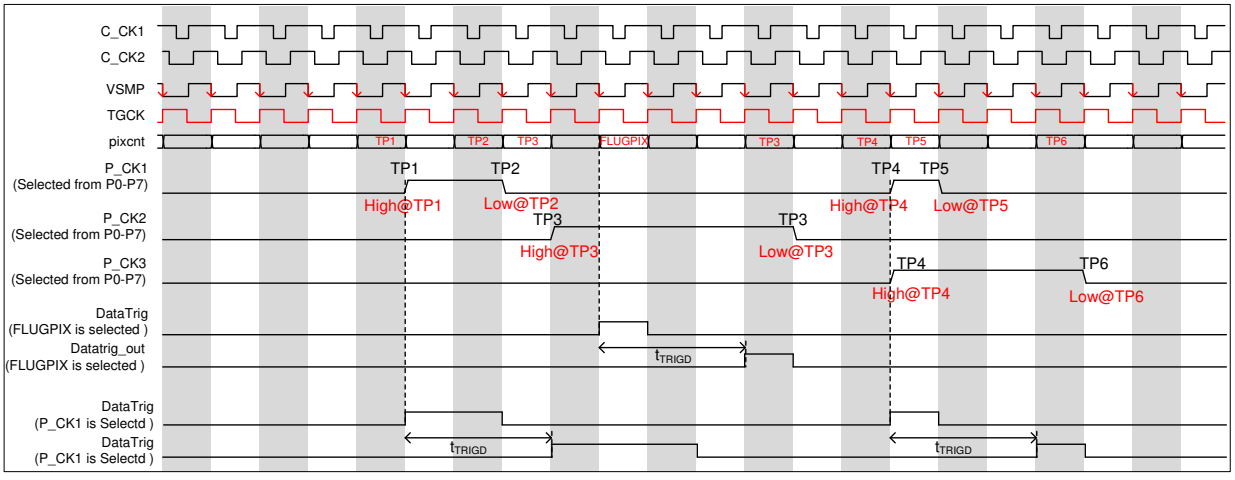

Figure 21 TG Pulse Toggle Setting and Data Trigger Timing

TG PULSE

The WM8233 can generate 8 TG pulses internally (PO0 – PO7). These pulses are generated by the toggle point setting registers (TP*) and polarity setting registers (POL*_PO*). WM8233 provided up to 32 toggle point by using TP0 to TP31. PO0-PO7 signals can be assigned to CLK2-CLK11 by SEL_PCK* and SEL_CLK* register.

TRIGGER DATA

The WM8233 can implement trigger data in LVDS output.(S0,S1,S2,S3 and S4) This can be selected by two methods. One is the FLAGPIX register which can be set one pixel for each line. The other is to apply a PO* pulse. Figure 21 shows the trigger data implementation timing.

CHANNEL ID

Also WM8233 can implement channel identification data instead of trigger data. Table 11 shows the matrix of input channel and channel ID.

	ID[2]	ID[1]	ID[0]
IN1	0	0	1
IN2	0	1	0
IN3	0	1	1
IN4	1	0	0
IN5	1	0	1
IN6	1	1	0

Table 11 Channel ID

Channel ID can be assigned to flag data (S0, S1, S2, S3 or S4). The following is the example of channel ID assignment.

Example: Assigned channel ID to flag data as ID[2] =S1, ID[1]=S2, ID[0]=S3.

If output data is as follows, channel ID will be IN1. (i.e. ID[2] =S1=0, ID[1]=S2=0, ID[0]=S3=1)

A							
D5	S0	S1	S2	IN1[0]	IN1[1]	IN1[2]	IN1[3]

Channel ID Setting Limitation

There are some notices to assign channel ID. It's depending on LVDS output format. (refer to OUTPUT DATA FORMAT)

1) 10-bit 5pair mode LVDS output

In this mode, channel ID will be IN1 or IN4 only.

Case-1 ID indicate IN1

A							
D5	S0	S1	S2	IN1[0]	IN1[1]	IN1[2]	IN1[3]

TG MASK TIMING

The WM8233 has a TG clock mask function. M1, M2 and M3 pulses specify the mask period; T1 and T2 pulses are used for changing the signal polarity during the mask period. C_CK1 and C_CK2 are applied to the M pulse only; they cannot be applied to the T pulse. C_CK3 and C_CK4 are applied to M1 and T1; C_CK5 and C_CK6 are applied to M2 and T2. The mask timing is synchronized with TGCKO rise edge.

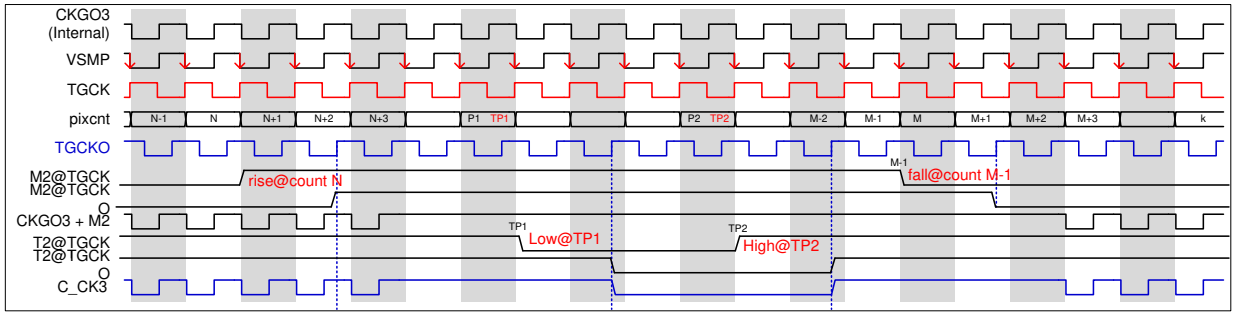

Figure 22 TG Mask Timing

PROGRAMMABLE AUTOMATIC BLACK LEVEL CALIBRATION (BLC)

The Programmable Automatic Black-Level Calibration (BLC) function is to adjust the D.C. offset of the output data such that the digital output code for black pixels is calibrated to a target black level value. The D.C. offset is determined during the optically-black pixels at the beginning of the linear sensor and removed during the image-pixels as shown in Figure 24.

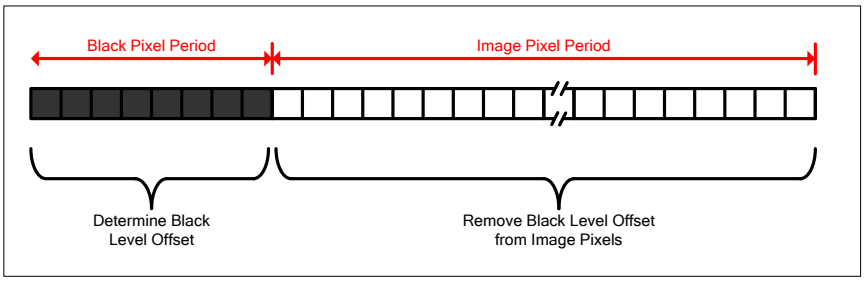

Figure 24 Linear Sensor Model

The automatic black level calibration operates assuming 12-bits ADC resolution. Adjustments to calculations must be made for different ADC resolutions.

The black level calibration process occurs in two stages as shown in Figure 25 below:

- **Coarse Adjust Calibration -** This is a mixed signal loop which removes the coarse offset by adjusting the offset DAC.
- **Fine Adjust Calibration -** This is a digital loop which removes the remaining offset with better noise tolerance, utilising ADC over-range to improve the dynamic range of the system.

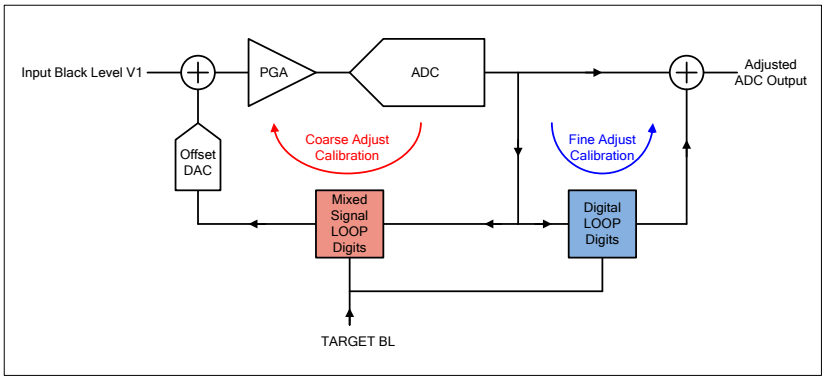

Figure 25 BLC Top-Level Circuitry

TARGET CODES

The user must specify a target black level for each channel through the registers TARGETINP*. If, during the black-pixel period, the average ADC output code was, for example, 100 and the user specified the target black level code to be 10, the BLC circuitry would determine 90 codes should be subtracted from the ADC output. These 90 codes will then be subtracted from every image-pixel code output from the ADC.

Note – changing the PGA gain affects the black-level through the device; the gain should therefore not be changed during a BLC procedure. If the PGA gain changes, then the BLC routine should be re-run.

The automatic black level calibration feature operates with the assumption of a 12-bit ADC resolution. The register settings for Target Codes (TARGETINP*) should be set differently depending on the ADC

resolution being used. As TARGETINP* is an 8 bit register, the 4 MSBs of a data output code cannot be changed.

16-bit ADC Resolution

For 16-bit resolution the target code entered into TARGETINP* will ignore the 4 MSBs and 4 LSBs of the 16-bit data output. For example if the desired code out is 0000111111110001, the value entered into TARGETINP* would be 11111111.

10-bit ADC Resolution

For 10-bit resolution the 4 MSBs of the 10-bit data output code will be ignored. The 2 LSBs of the target code should be set to '00'. For example if the desired code out is 0000111111, the value entered into TARGETINP* would be 11111100.

BLC SCENARIOS OF OPERATION

The BLC can be used in various ways to suit the application, for example calibration can be done once per page or once per line. Three potential scenarios of operation are suggested below.

Note: The registers FRAME_START and SEQ_START when set high by the user will automatically be set low by the device.

SCENARIO 1

In this scenario, Coarse Adjust Calibration is enabled for the 1st line; Fine Adjust Calibration is enabled for every line, with the Fine Adjust Calibration result recalculated every line. This scenario is suitable for dealing with large amounts of D.C. drift throughout a frame; but this is at a cost of potential line-by-line variation in the Fine Adjust result (dependent on sensor noise and the PGA gain). Table 12 shows which registers are required for this scenario with example settings.

SETUP REGISTER	BPIX_AVAIL	CADUR	FRAME_START	FA_EVERYLINE
Value	50	2	1	1

Table 12 Example Register Settings for Scenario 1

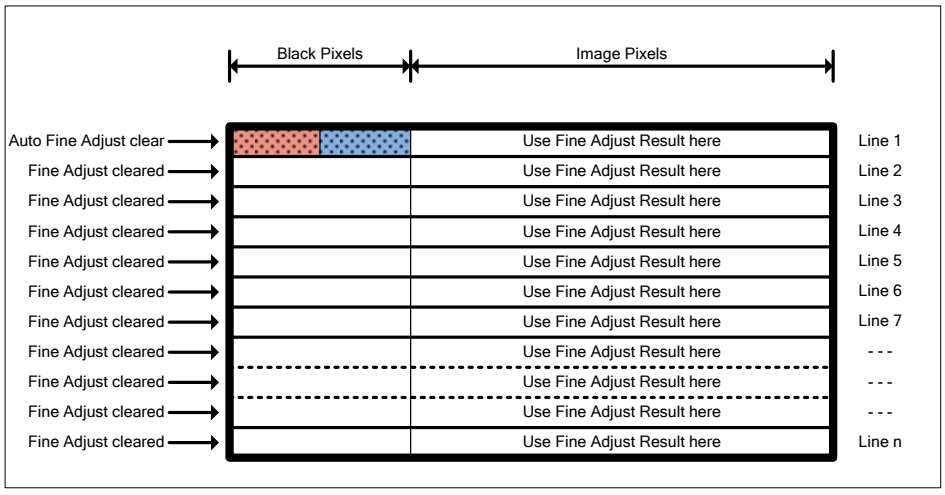

Figure 26 Scenario 1

SCENARIO 2

In this scenario, Coarse Adjust and Fine Adjust Calibration is enabled for the 1st line, with the Fine Adjust result updated on the 1st line only. This scenario is suitable for adjusting for black-level D.C. drift on a frame-by-frame basis; there will be no line-by-line variation in the black-level from the BLC circuitry. Table 13 shows which registers are required for this scenario with example settings.

SETUP REGISTER	BPIX_AVAIL	CADUR	FRAME_START
Value	50	2	1

Table 13 Example Register Settings for Scenario 2

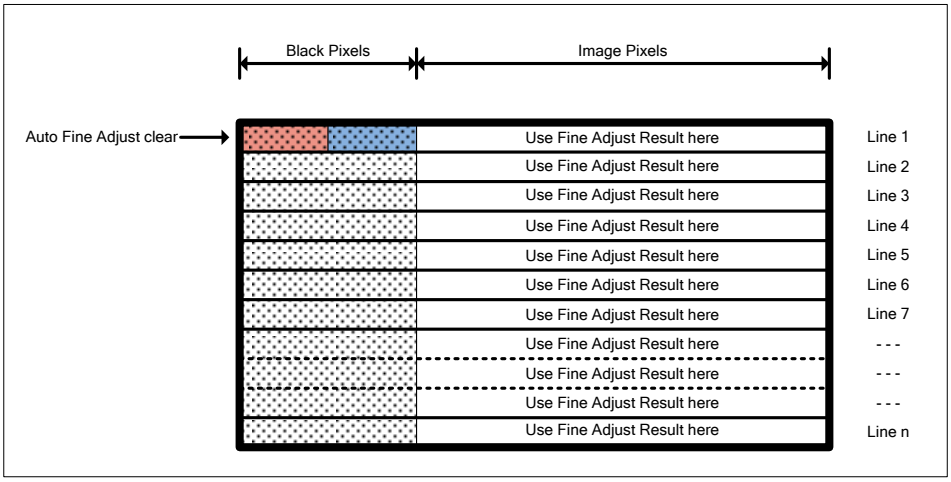

Figure 27 Scenario 2

SCENARIO 3

In this scenario, Coarse Adjust Calibration is enabled for the 1st line; Fine Adjust Calibration is enabled for every line, with the Fine Adjust result accumulated throughout frame and used every line. This scenario allows any variation in the black-level to be tracked throughout the frame by accumulating the Fine Adjust result over multiple lines. This method does not deal with as large amounts of D.C. drift throughout the frame as scenario 1, but it will produce less line-by-line variation. Table 14 shows which registers are required for this scenario with example settings.

SETUP REGISTER	BPIX_AVAIL	CADUR	FRAME_START	FA_EVERYLINE	FA_ACCUM
Value	50	2	1	1	1

Table 14 Example Register Settings for Scenario 3

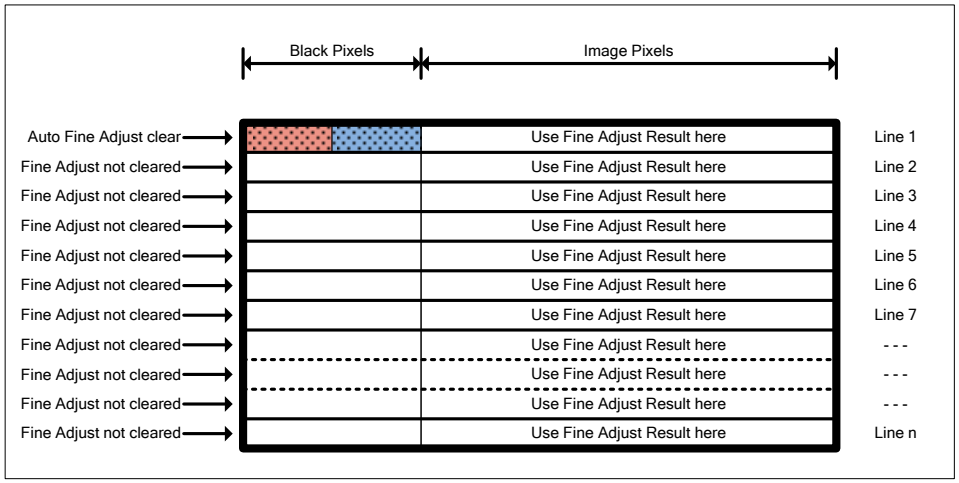

Figure 28 Scenario 3

AUTOMATIC GAIN CONTROL (AGC)

The Automatic Gain Control (AGC) function is to adjust the gain to an appropriate level for a range of input signal levels. The AGC function is enabled by AGC_EN register set to 1. The gain control process has three stages as shown in Figure 29 below:

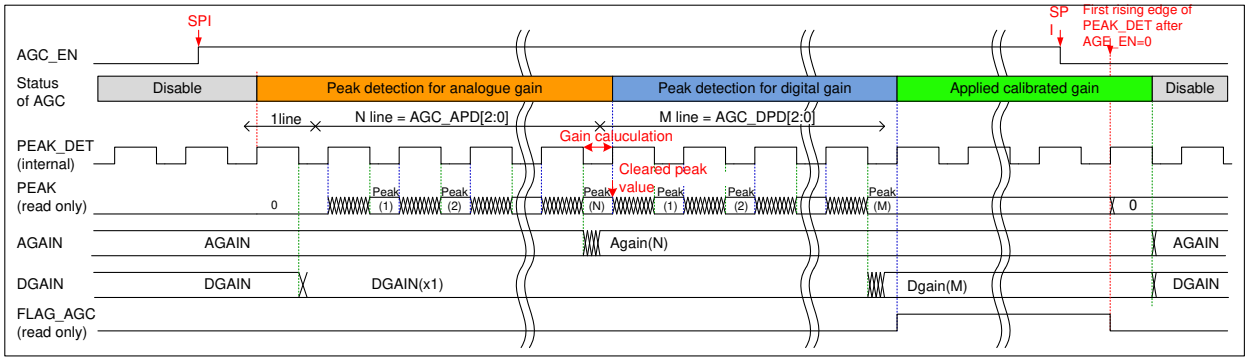

Figure 29 Automatic Gain Control

Analogue Gain Calibration

The analogue gain is kept to the previous setting for (AGAIN), and the digital gain is set to x1 (DGAIN=12'd2048) automatically. During the PEAK_DET=high period, peak detection is executed and then calculates an appropriate analogue gain (Again(N)) while PEAK_DET=low period. This period requires at least 200 pixels. The number of peak detection cycle is selectable by the AGC_APD register. The minimum cycle is 0 (In this case the analogue gain calibration is not executed), and the maximum cycle is 7 lines. The peak value is cleared when the analogue peak detection finished.

Digital Gain Calibration

The analogue gain is set to the calibrated value (Again(N)), and the digital gain is set to x1 (DGAIN=12'd2048) automatically. The peak detection and digital gain calibration functions are then executed. The number of peak detection lines is selectable by the AGC_DPD register. The minimum cycle is 0 (In this case the digital gain calibration is not executed), and the maximum cycle is 7 lines.

Applied Calibrated Analogue and Digital Gain

The analogue and digital gain are holding calibrated value until AGC_EN register set to 0.

Again(N) = AGC_TARGETINP* / peak(n) x AGAIN

Dgain(M) = (AGC_TARGETINP* – TARGETINP*) / (peak(M) – TARGETINP*)

LINE-BY-LINE OPERATION

Certain linear sensors give colour output on a line-by-line basis. i.e. a full line of red pixels followed by a line of green pixels followed by a line of blue pixels.

The WM8233 can accommodate this type of input by setting the LINEBYLINE register bit high. The offset and gain values that are applied to every input channel can be selected, by internal

multiplexers, to come from IN4, IN5 or IN6 offset and gain registers. This allows the gain and offset values for each of the input colours to be setup individually at the start of a scan.

When register bit ACYC=0 the gain and offset multiplexers are controlled via the INTM[1:0] register bits. When INTM=00 the IN2 offset and gain control registers are used to control every input channel, INTM=01 selects the IN4 offset and gain registers and INTM=10 selects the IN6 offset and gain registers to control every input channel.

When register bit ACYC=1, 'auto-cycling' is enabled, and the input channel switches to the next offset and gain registers in the sequence by TGSYNC. The sequence is IN2 → IN4 → IN6 → IN2… offset and gain registers applied to every input channel.

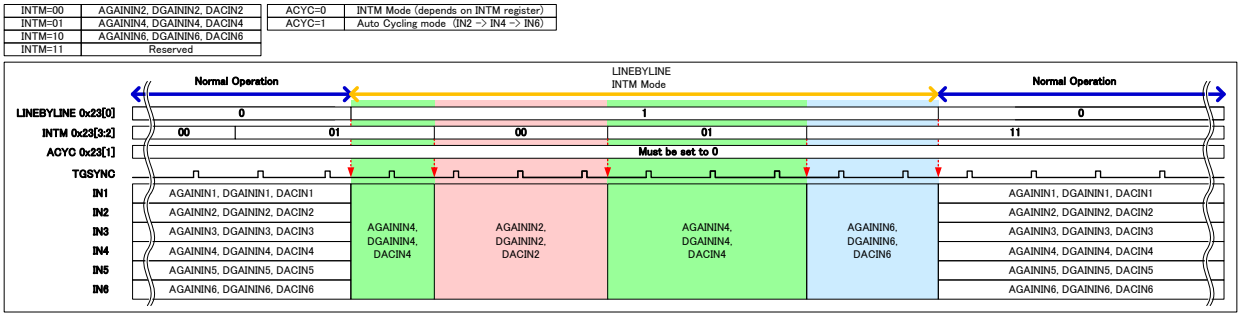

Figure 30 Line-by-Line Operation (ACYC=0, INTM mode)

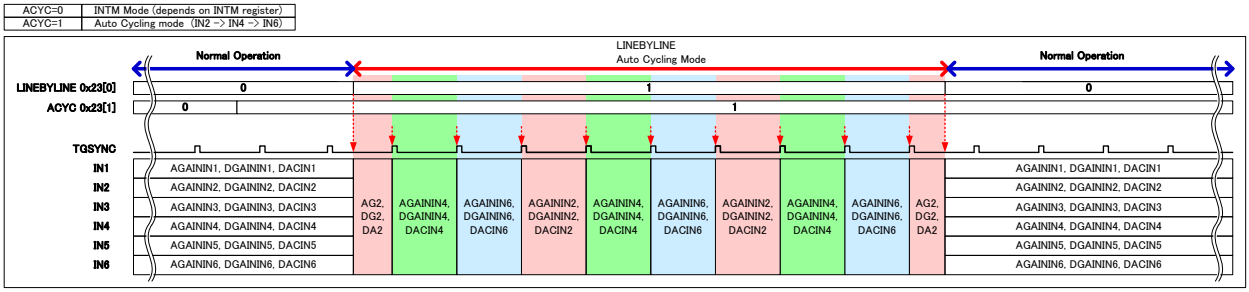

Figure 31 Line-by-Line Operation (ACYC=1, Auto-cycling mode)

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
R35 (23h) Cycle mode control	3:2	INTM[1:0]	00	When LINEBYLINE=1, controls the GAIN and DAC mux selector when ACYC=0 00 = IN2 01 = IN4 10 = IN6 11 = reserved

	0	LINEBYLINE	0	select line by line operation 0=normal operation 1=Line by Line operation

TEST PATTERN GENERATOR

WM8233 has test pattern generator which can be used for interface verification between AFE data output and back-end devices without sensor signal input. This function can be presented in several different patterns by PGPAT[1:0] and PGMARCH registers as shown below. The PGLEVEL, PGWIDTH1 and PGWIDTH2 are the parameter to define the pattern level and width. The PGLEVEL register has 16bit length, PGWIDTH1 and PGWIDTH2 has 8bit length.

Note that test pattern generator is required TGSYNC input. (i.e. this can be used under TG slave mode operation only.)

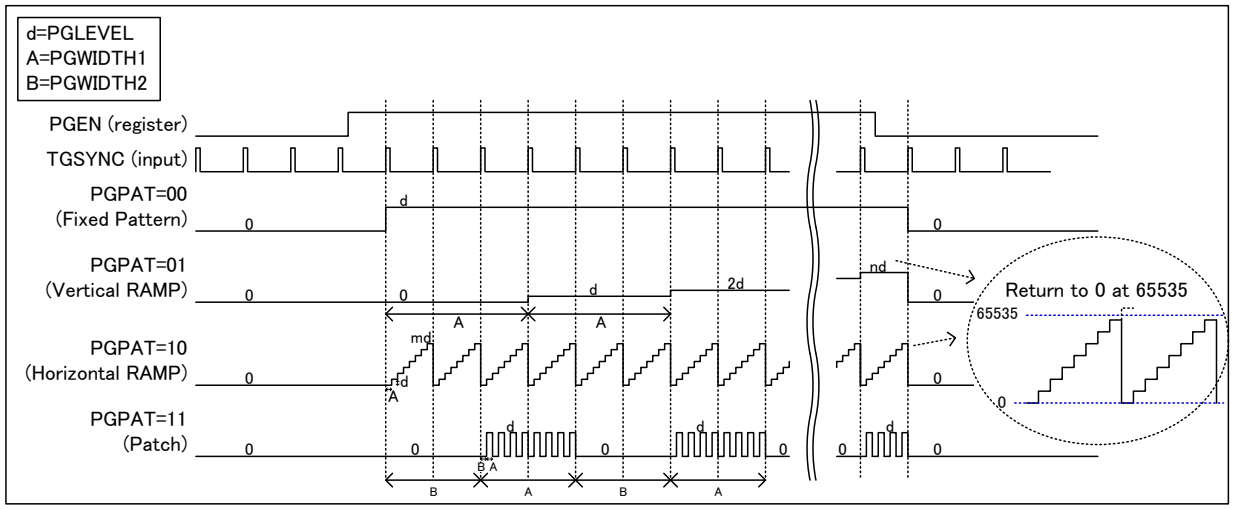

Figure 32 Test Pattern Output Data Formats

REGISTER SETTING PROCEDURE

OVERALL

Figure 35 shows the overall procedure for WM8233 register setting. Every register can be configured without MCLK and TGSYNC input, but the following Note1~3 must be followed before starting normal operation.

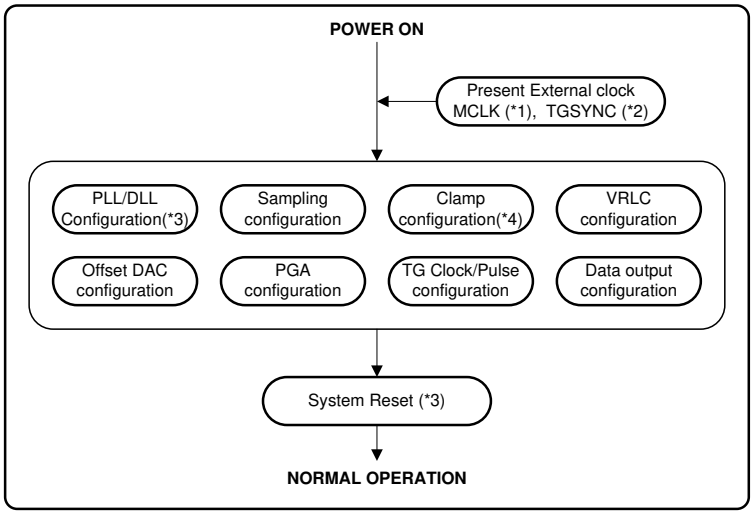

Figure 35 Overall Procedure

Notes:

1. MCLK must be present before System Reset. Also, System Reset must be done when MCLK is interrupted during normal operation.
2. TGSYNC input is required in TG slave mode. Also, this must be present before normal operation.
3. System Reset must be done after PLL/DLL configuration.

PLL/DLL CONFIGURATION

PLL and DLL registers must be configured depending on the MCLK frequency and data output format. See “PLL DLL Setup” section for details of configuring PLL/DLL registers. The device must be reset after PLL/DLL configuration as shown in Figure 36.

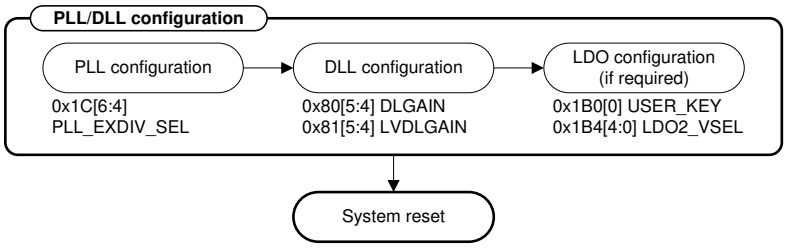

Figure 36 PLL/DLL Configuration

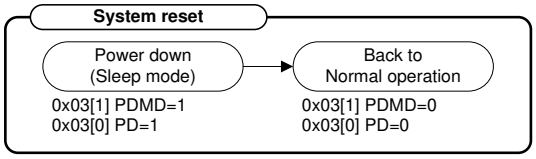

Figure 37 System Reset

SAMPLING CONFIGURATION

Sampling configuration is the setting for input signal polarity and sampling timing. See “CDS/Non-CDS Processing” section for details of configuring this register.

Non-CDS mode (S/H mode): RSMP configuration is not required.

CDS mode: RSMP and VSMP configurations are required.

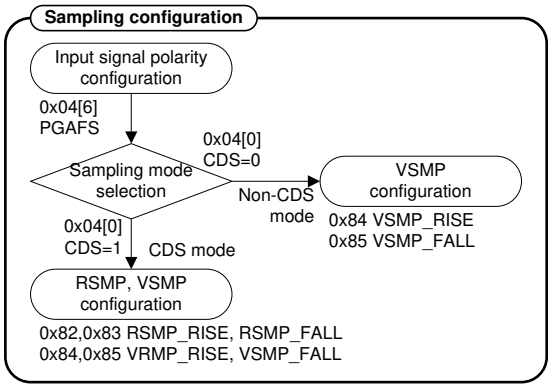

Figure 38 Sampling Configuration

CLAMP CONFIGURATION

Clamp configuration is the setting for clamp modes and clamp timing configuration in line clamp mode. See “Reset Level Clamping (RLC)” section and “CDS/Non-CDS Processing” section for details of configuring this register.

TG enabled: This must be enabled when AGC function is used.

Line clamp configuration: Line clamp operation is enabled during CLAMP_RISE ~ CLAMP_FALL period. Also, the source follower should be set to prevent clamp voltage drop in line clamp mode.

Pixel clamp (Bit clamp) mode: The pixel clamping is enabled during RSMP = high period. This mode can be used in CDS operation only.

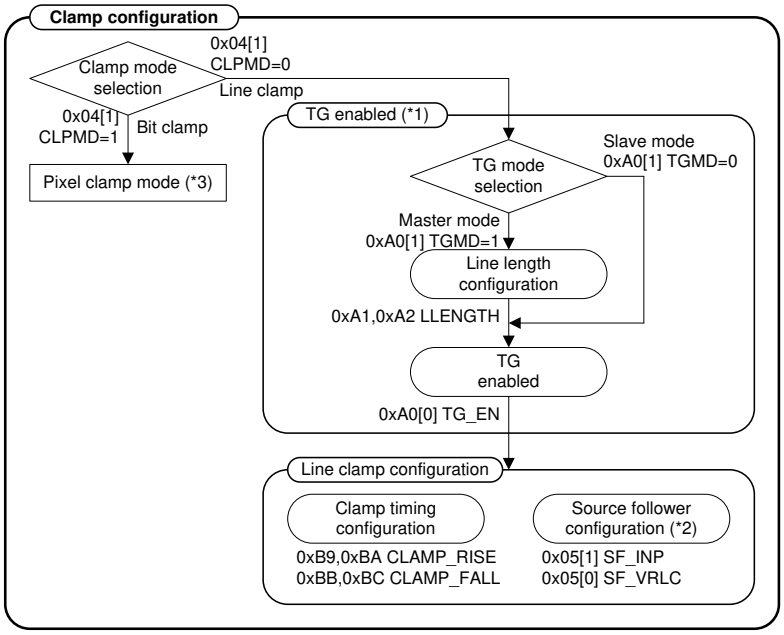

Figure 39 Clamp Configuration

Notes:

1. This must be set when Line clamp is used.
2. SF_INP and SF_VRLC must be set both when source follower enabled
3. Pixel clamp can be used in CDS operation only.

VRLC CONFIGURATION

VRLC configuration is the setting for VRLC voltage, which is used for input signal clamp voltage at line clamp operation. The VRLC voltage is also used as the reference level of non-CDS (S/H) operation. See “Reset Level Clamping (RLC)” section and “CDS/Non-CDS Processing” section for details of configuring this register.

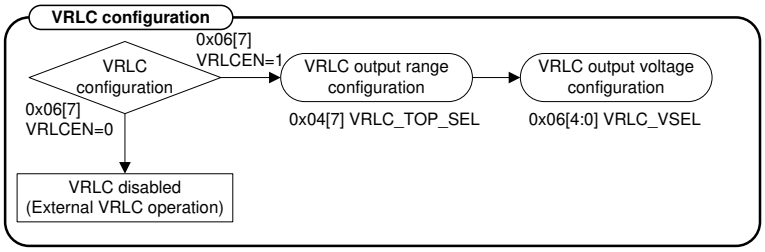

Figure 40 VRLC Configuration

OFFSET DAC CONFIGURATION

The offset DAC is used for black level offset compensation. WM8233 has BLC function to calibrate black level. In this mode, the offset DAC will be configured automatically. When this function is not needed, the offset DAC can be configured manually. See “Overall Signal Flow Summary” section for details of offset DAC configuration, and see “BLC Scenarios of Operation” for details of BLC sequence.

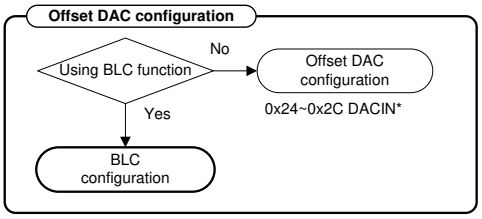

Figure 41 Offset DAC Configuration

BLC Configuration

TG enabled: This must be enabled when AGC function is used.

BLC start pixel configuration: This is start pixel configuration for BLC.

BLC period configuration: BLC will operate while this period from BLC start pixel.

BLC target level configuration: This is configuration for the target level of black pixel.

Coarse adjust configuration:

CADUR: This is the coarse adjust iteration setting during BLC period.

CA_EVERYLINE: When this register set, coarse adjust will operate on every line.

Fine adjust configuration: This is configuration for Coarse adjust iteration.

FA_EN: When this register set, fine adjust will operate during BLC period.

FA_EVERYLINE: When this register set, fine adjust will operate on every line.

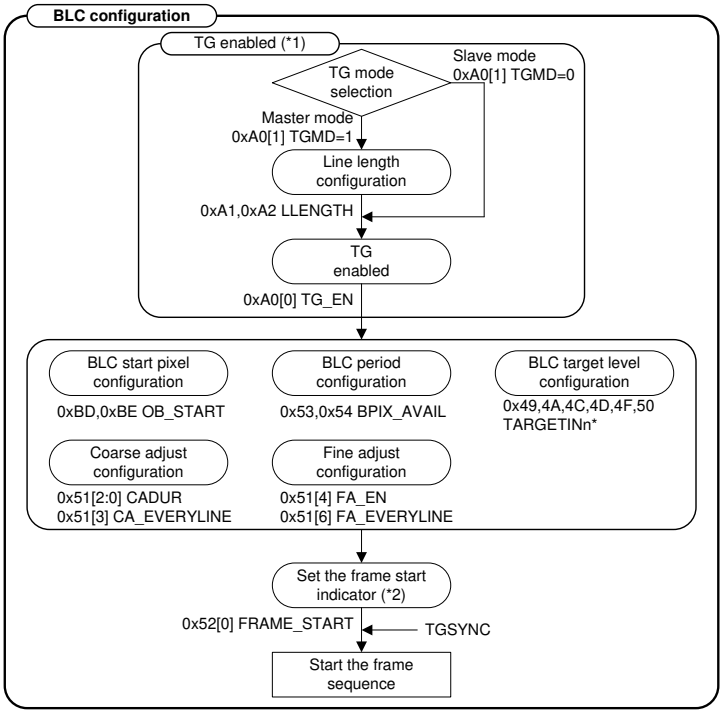

Figure 42 BLC Configuration

Notes:

1. This must be set when BLC is used.
2. With this register set, frame sequence will be started after TGSYNC is recognized. Therefore this should be set within the last line of previous frame.

PGA CONFIGURATION

The WM8233 provides an Automatic Gain Control (AGC) function. The output code is calibrated to target level by this automatic gain control function. See “Automatic Gain Control (AGC)” section for details of AGC sequence. Also, see the following instruction to configure AGC related registers. The analogue PGA (APGA) and digital PGA (DPGA) can be configured manually when AGC is not required. See “Offset Adjust and Programmable Gain” section for details of PGA configuration.

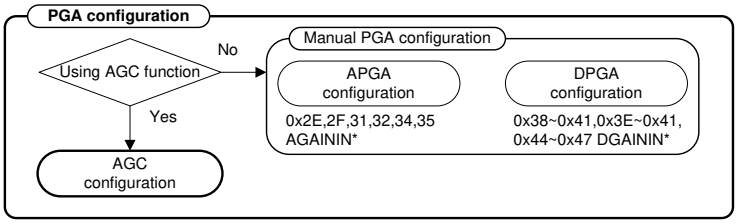

Figure 43 PGA Configuration

AGC CONFIGURATION

Figure 44 shows the procedure for AGC Configuration.

TG enabled: This must be enabled when AGC function is used.

AGC averaging factor configuration: This is averaging factor for peak level detection.

AGC APD/DPD configuration: This is line iteration setting for peak level detection.

AGC target level configuration: The output code will be calibrated to this target level after APGA and DPGA calibration. APGA and DPGA keep calibrated gain value while AGC is enabled. (AGC_EN=1)

Peak detection period configuration: This is the setting for peak detection period.

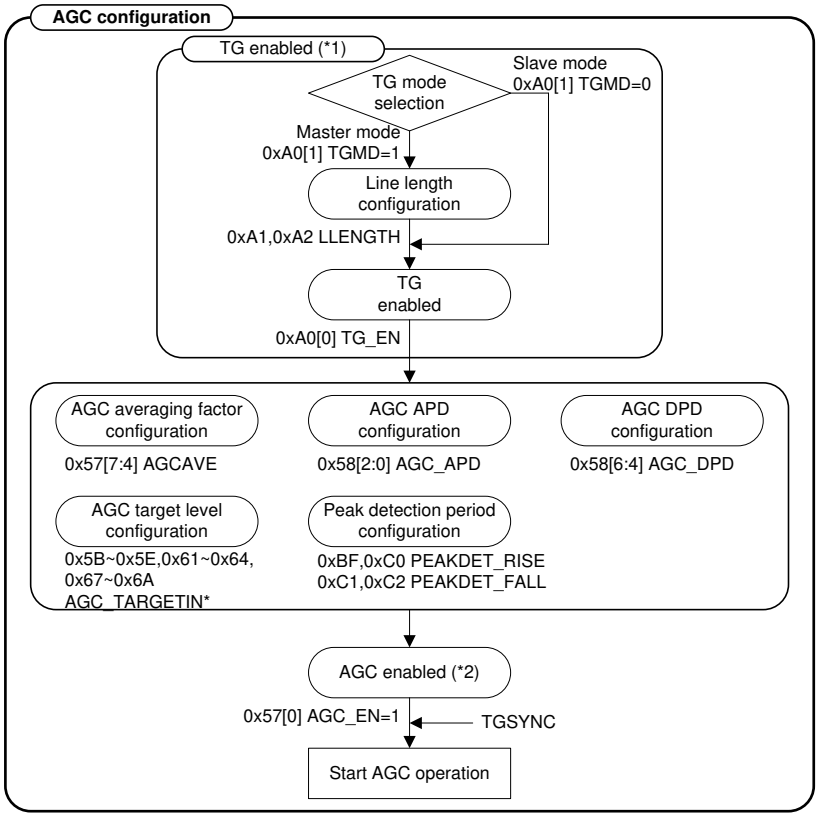

Figure 44 AGC Configuration

Notes:

1. This must be set when AGC is used.
2. With this register set, AGC sequence will be started after TGSYNC is recognized.

TG CLOCK CONFIGURATION

Figure 45 shows the procedure for TG Clock Timing and Mask Configuration. CLK1~CLK6 can be configured as clock type output. See “Sensor Timing Generation” section for details of TG function.

TG enabled: This must be enabled when TG mask function is used.

Mask period configuration: TG clock will be masked while mask signal is high. The rising and falling timing is configured by M*_RISE/FALL register. See “TG Mask Timing” section for details of this function.

Toggle point configuration: Pulse toggle timing is configured by toggle point setting (TP0~TP31). TP* register consists of toggle point setting bit (TP value bit) and enable bit. The enable bit must be set when TP is used. Unused TP can be disabled, but it must be followed Note-2 as described below.

T1 and T2 polarity configuration: T1 and T2 are internal signal to set the TG signal polarity during mask period. See “TG Mask Timing” section for details of this function.

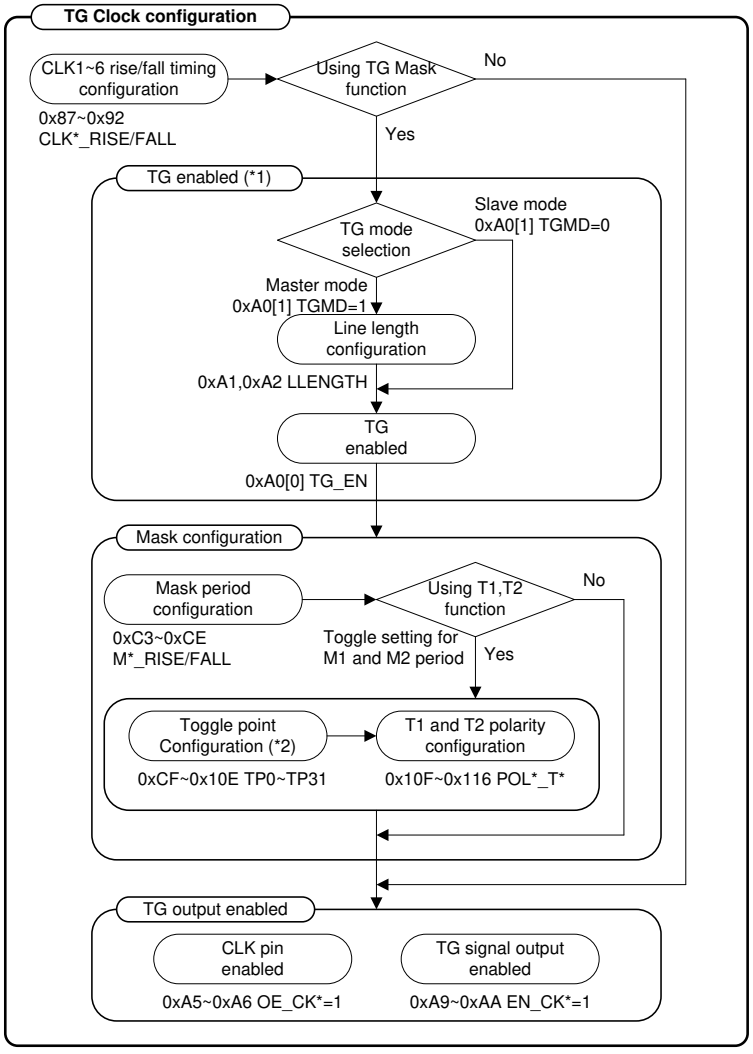

Figure 45 TG Clock Configuration

Notes:

1. This must be set when the TG-MASK function is used.
2. When configure Toggle point (TP), it must be used from TP0 in ascending order. Also, TP pixel counter value must be set as TP0<TP1<TP2 …..

TG PULSE CONFIGURATION

Figure 46 shows the procedure for TG Pulse Configuration. CLK2~CLK11 can be configured as pulse type output. See “Sensor Timing Generation” section for details of TG function.

TG enabled: This must be enabled when TG pulse function is used.

Toggle point configuration: Pulse toggle timing is configured by toggle point setting (TP0~TP31). TP* register consists of toggle point setting bit (TP pixel counter value bit) and enable bit. The enable bit must be set when TP is used. Unused TP can be disabled, but this must be followed Note-1 as described below.

PO0~PO7 configuration: PO0~PO7 are internal pulse for CLK pulse output. Pulse toggle timing is configured by polarity setting register (0x117~0x136 POL*_PO*).

CLK2~6 pulse out configuration: CLK2~CLK6 can select output signal type, clock type or pulse type by SEL_CK* register bit. This register must be set when pulse output is required.

PO assignment: Internal PO* pulse will be assigned to CLK2~CLK11 pin with this register.

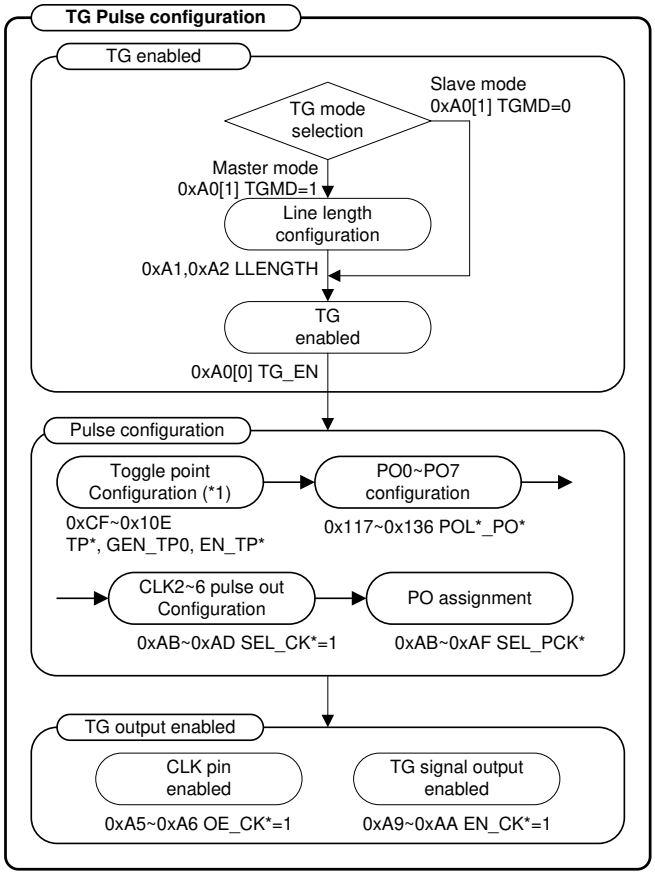

Figure 46 TG Pulse Configuration

Notes:

1. When configure Toggle point (TP), it must be used from TP0 in ascending order. Also, TP pixel counter value must be set as TP0<TP1<TP2

DATA OUTPUT CONFIGURATION

Figure 47 shows the procedure for Data Output Configuration. WM8233 provides 10-bit CMOS output and various LVDS output formats. See “Output Data Format” section for details of LVDS and CMOS output format.

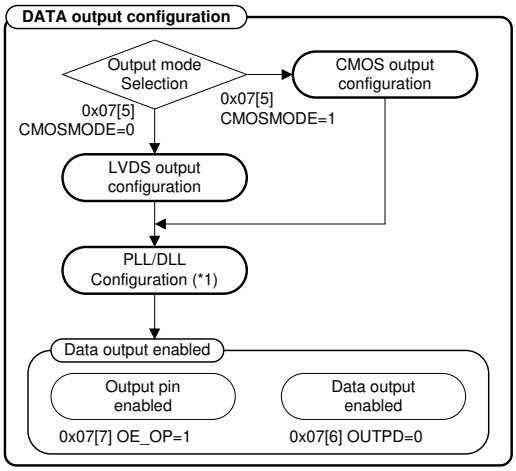

Figure 47 Data Output Configuration

Notes: 1. For details, see “PLL/DLL Configuration” section.

CMOS Output Configuration

Figure 48 shows the procedure for CMOS Output Configuration. Output drivability must be set when CMOS output is selected. In CMOS output mode, flag signal will be output from DCLKN/OC[2] pin.

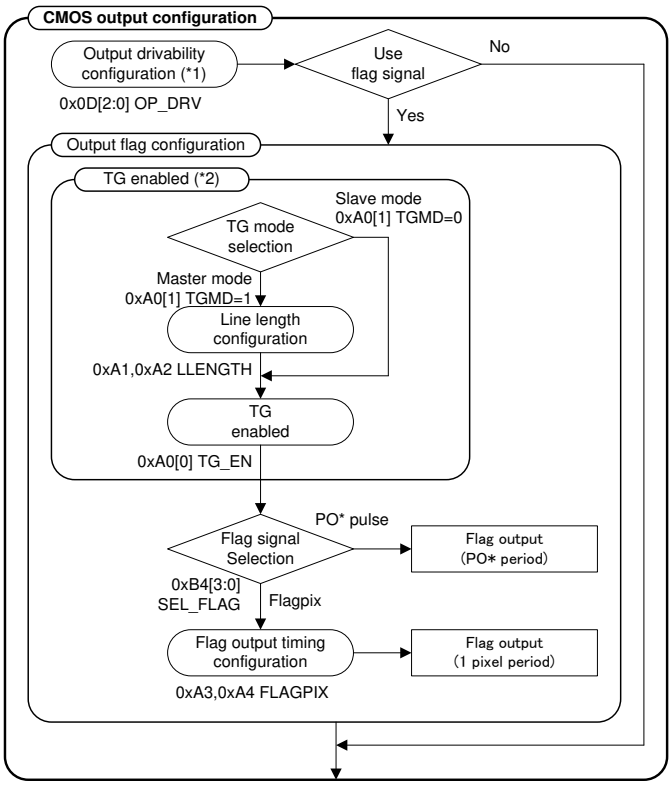

Figure 48 CMOS Output Configuration

Notes:

1. OP_DRV is valid when 0x0D[3] DRV_CTRL set to 0.When DRV_CTRL set to 1, OP_DRV is invalid, and drivability of output pin can be configured individually by 0x0E~0x13 OP*_DRV and OC*_DRV.
2. This must be set when flag is used.

LVDS Output Configuration

Figure 49 shows the procedure for LVDS Output Configuration.

LVDS format configuration: LVDS format can be configured by this register. See "Output Data Format" section for details of each format.

Data output order configuration: Data output order can be set by this register. See "LVDS Data Output Order" section for details of output order.

LVDS amplitude configuration: This is LVDS signal amplitude configuration. The LVDS amplitude is configured using the LVDS_AMP register field. Selections in the range 50mV to 200mV are supported. Note that the default code (110) should not be used.

LVDS VCM level configuration: This is LVDS common mode voltage configuration.

LVDS DCLK pattern configuration: This is DCLK output pattern configuration.

Output flag configuration: Flag type can be selected from start flag or cannel ID. See "Trigger Data" and "Channel ID" section for details of output flag. When this is not used, flag data (S~S4) will be always 0.

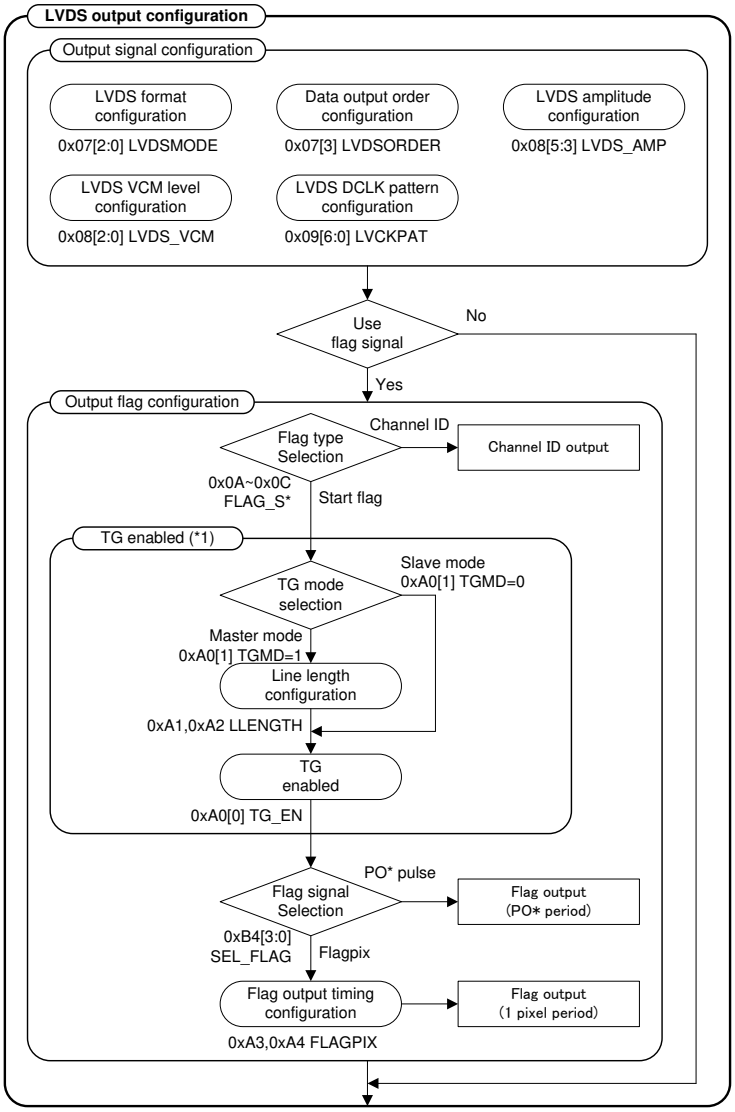

Figure 49 LVDS Output Configuration

Notes:

1. This must be set when start flag is used.

REGISTER MAP

The following table describes the location of each control bit used to determine the operation of the WM8233. Not all registers are used and any registers not listed should be set to zero.

R448 (1C0h)	USER_KEY2	0	0	0	0	0	0	0	USER_KEY2	00h
R459 (1CBh)	Comp control	0	0	0	0	0	0	PT_COMP[1:0]		01h

Notes:

1. To change the LDO2 control, the USER_KEY bit must be set to '1'.
2. If it's not required to change the LDO2 voltage, these registers must be set as default.
3. To change the Comp control, the USER_KEY2 bit must be set to '1'.
4. If it's not required to change this register, must be set as default.

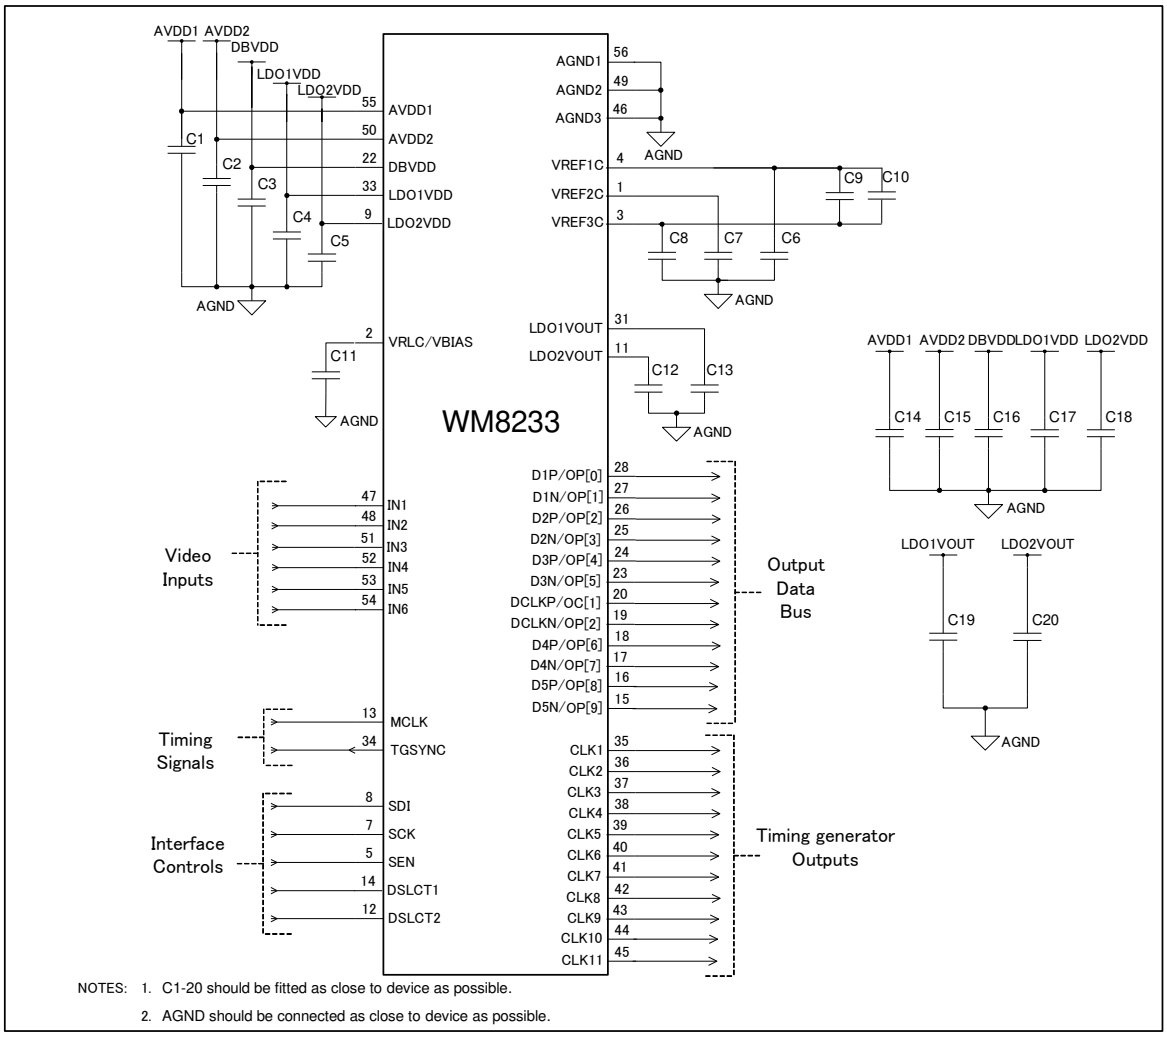
APPLICATIONS INFORMATION

RECOMMENDED EXTERNAL COMPONENTS



NOTES: 1. C1-20 should be fitted as close to device as possible.

2. AGND should be connected as close to device as possible.

Figure 50 External Components Diagram

RECOMMENDED EXTERNAL COMPONENT DESCRIPTION

COMPONENT REFERENCE	SUGGESTED VALUE	DESCRIPTION
C1	0.1uF	De-coupling for AVDD1
C2	0.1uF	De-coupling for AVDD2
C3	0.1uF	De-coupling for DBVDD
C4	0.1uF	De-coupling for LDO1VDD
C5	0.1uF	De-coupling for LDO2VDD
C6	0.1uF	De-coupling for VREF1C
C7	0.1uF	De-coupling for VREF2C
C8	0.1uF	De-coupling for VREF3C
C9	0.01uF	High frequency decoupling between VREF1C and VREF3C
C10	10uF	Low frequency decoupling between VREF1C and VREF3C
C11	1uF	De-coupling for VRLC/VBIAS
C12	1uF	De-coupling for LDO1VOUT
C13	1uF	De-coupling for LDO2VOUT
C14	10uF	Reservoir capacitor for AVDD1
C15	10uF	Reservoir capacitor for AVDD2
C16	10uF	Reservoir capacitor for DBVDD
C17	10uF	Reservoir capacitor for LDO1VDD
C18	10uF	Reservoir capacitor for LDO2VDD
C19	10uF	Reservoir capacitor for LDOOUT
C20	10uF	Reservoir capacitor for LDOOUT

REF	JEDEC, MO-220, VARIATION VLLD-2			

NOTES:
1. DIMENSION b APPLIED TO METALLIZED TERMINAL AND IS MEASURED BETWEEN 0.15 mm AND 0.30 mm FROM TERMINAL TIP.
2. ALL DIMENSIONS ARE IN MILLIMETRES
3. THE TERMINAL #1 IDENTIFIER AND TERMINAL NUMBERING CONVENTION SHALL CONFORM TO JESD 95-1 SPP-002.
4. COPLANARITY APPLIES TO THE EXPOSED HEAT SINK SLUG AS WELL AS THE TERMINALS.
5. THIS DRAWING IS SUBJECT TO CHANGE WITHOUT NOTICE.
6. REFER TO APPLICATIONS NOTE WAN_0118 FOR FURTHER INFORMATION.

REVISION HISTORY

DATE	REV	ORIGINATOR	CHANGES	PAGE
13/10/2010	1.0	AA	First Release	
08/12/11	3.0	JMacD	Product status updated to pre-production,	
10/12/11	3.0	AA	Corrected DAC description 4-bit to 8bit	1
			Corrected temperature range to -40	5.8
			Corrected ADCFS characteristics	9,10
			Corrected RLCDAC resolution	10
			Corrected Parameter name and Register name for RLCDAC	10,38
			Added test condition for TG output	11
			Corrected Supply Currents	21
			Corrected Clamp timing diagram	24
			Corrected Signal flow summary (removed INVOP description)	38,48
			Corrected Register Map (ADCFS)	
			Corrected Channel ID description INP to IN	27
			Corrected TG MASK description	31
14/12/12	4.0	AA	Added spec of channel to channel offset matching	9
			Corrected RLCDAC resolution	10
			Corrected offset DAC INL DNL spec	10
			Corrected supply current for full power down mode	11
			Updated timing specification	16-18
			Added description for 3pair, 4pair LVDS mode	26-28
			Added LVDS output order	29
			Corrected figure for ADC INPUT BLACK LEVEL ADJUST	20
			Corrected figure for overall signal flow	21
			Added description for PLL DLL setup	22
			Corrected TG timing diagram	31-33
			Added EXTENDED REGISTERS	50,118
			Corrected description for R28	60
			Corrected description for R128,R129	72,73
07/02/13	4.1	AA	Corrected missing description. (ADC PGA Bias current control, PLL DLL setup, Output data format)	21-30
17/02/14	4.2	AA	Corrected description of conversion rate	1
			Corrected description of reference DAC resolution	1
			Updated test condition for output noise specification	9
			Corrected device ID descriptions (Table 2 and Table 3)	13,14
			Corrected RESET CLAMPING description	17,18
			Corrected CDS/Non-CDS PROCESSING description	19
			Updated PLL and DLL setting table	22
			Corrected TG-master/slave mode timing chart	34,35
			Added TGSYNC low period specification	35
			Added description for LINE BY LINE operation	48,58,74
			Added description for TEST PATTERN GENERATOR	49,50,71,72
			Added description for Register setting procedure	51~57
22/05/14	4.3	AA	Added data latency specification	15
			Updated tPER, tMCLKH and tMCLKL description	15
			Removed tPER and tMCLKD description	32,34
			Removed tTRGD and tPCKD description	35
			Updated Data trigger timing delay specification	36
			Corrected TG MASK TIMING description	42
			Added description of Data Output Configuration	59,60
			Corrected register description of SEL_PCK7,8,9,10,11	98,99

DATE	REV	ORIGINATOR	CHANGES	PAGE
19/08/14	4.4	AA	Corrected pin name (PO0~PO9)	5,61,72~74
20/10/15	4.5	PH	Test limit (min/max) conditions added in Elec Chars Signal timing limits added Amendment to LVDS_AMP description	8-10 15, 35 60, 70
27/11/15	4.6	PH	Electrical characteristics updated	8-10
25/03/16	4.7	PH	Digital pin output impedance updated	10
