### DESCRIPTION

The VSP1900 is a CCD vertical clock driver with electric-shutter support. This device is composed of eight vertical transfer channels, which support both 3-field CCD and 2-field CCD operation. The VSP1900 contributes low power consumption and parts number reduction in the system.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

**DESCRIPTION**

The VSP1900 is a CCD vertical clock driver with electric shutter. The VSP1900 is composed of five 3-state and three 2-state vertical transfer channels, which support both 3 field and 2 field CCD operation. The VSP1900 contributes low power consumption and parts number reduction in the system.

**OPERATION**

**Power On/Off Sequence**

This is the same as the CCD power up sequence, when power on, VDD powers on first, VH, VM power on second, and VL powers on later. When powering off, VL powers off first, VH, VM power of second, and VDD powers off later.

**Vertical Transfer Signal**

The VSP1900 receives signals from TG (CCD timing generator). The input signal is converted into CCD operation voltage level by the level shifter. The level shifter circuits connect to a 2-state or 3-state driver, which is connected to the CCD input pin. While using a 2-field CCD, one of the 3-state drivers is used as a 2-state driver. The CH#N pin is pulled up internally, so that the VH level does not appear on the output pin.
